WARNING TO USERS IN THE UNITED STATES

FEDERAL COMMUNICATIONS COMMISSION (FCC)
LOCATION AND MONITORING SERVICE STATEMENT
47 CFR §90.351

NOTE: The user is required to obtain a Part 90 site license from the FCC to operate this radio frequency identification (RFID) device in the United States. See product label for FCC ID number. Access the FCC Web site at www.fcc.gov/Forms/Form601/601.html for additional information concerning licensing requirements.

NOTE: Users in all countries should check with the appropriate local authorities for licensing requirements.

FCC RADIO FREQUENCY INTERFERENCE STATEMENT
47 CFR §15.105(a)

NOTE: This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate RF energy and may cause harmful interference to radio communications if not installed and used in accordance with the instruction manual. Operating this equipment in a residential area is likely to cause harmful interference, in which case, depending on the laws in effect, the user may be required to correct the interference at their own expense.

NO UNAUTHORIZED MODIFICATIONS
47 CFR §15.21

CAUTION: This equipment may not be modified, altered, or changed in any way without permission from TransCore, LP. Unauthorized modification may void the equipment authorization from the FCC and will void the TransCore warranty.

USE OF SHIELDED CABLES IS REQUIRED
47 CFR §15.27(a)

NOTE: Shielded cables must be used with this equipment to comply with FCC regulations.

TransCore, LP
USA
Health Limits for Encompass 4 Reader Using Integrated Antenna (902 to 928 MHz)

Within the United States, environmental guidelines regulating safe exposure levels are issued by the Occupational Safety and Health Administration (OSHA).

Section 1910.97 of OSHA Safety and Health Standards 2206 legislates a maximum safe exposure limit of 10 milliwatts per square centimeter (mW/cm²) averaged over 6 minutes at 902 MHz.

Although not binding, other organizations such as the American National Standards Institute (ANSI) have issued similar guidelines that are more restrictive than the OSHA limits (ANSI C95.1). ANSI guidelines recommend a maximum safe power density in mW/cm² of:

### Frequency (in MHz)

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Power Density (mW/cm²)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500</td>
<td>0.60</td>
</tr>
</tbody>
</table>

Thus, the maximum permissible exposure for general population/uncontrolled exposure at 902 MHz is 0.60 mW/cm². The power limit is a six-minute average.

The RF power density generated by the Encompass 4 Reader was calculated using a maximum antenna gain of 9.5 dBi, equivalent to the antenna gain of the integrated antenna.

**Warning**

At 2 W transmitted power and a distance of 19.3 inches (49 cm) from the reader, the maximum power density calculated was less than 0.60 mW/cm². Install the reader at least 19.3 inches (49 cm) from the general public. Maintenance personnel must remain at least 8.66 inches (22 cm) from reader when system is operating.

The data confirms that the TransCore Encompass 4 Reader effectively meets OSHA requirements and thus does not represent an operating hazard to either the general public or maintenance personnel.
**Health Limits for Encompass 4 Reader Using External Antenna (902 to 928 MHz)**

Within the United States, environmental guidelines regulating safe exposure levels are issued by the Occupational Safety and Health Administration (OSHA).

Section 1910.97 of OSHA Safety and Health Standards 2206 legislates a maximum safe exposure limit of 10 milliwatts per square centimeter (mW/cm²) averaged over 6 minutes at 902 MHz.

Although not binding, other organizations such as the American National Standards Institute (ANSI) have issued similar guidelines that are more restrictive than the OSHA limits (ANSI C95.1). ANSI guidelines recommend a maximum safe power density in mW/cm² of:

<table>
<thead>
<tr>
<th>Frequency (in MHz)</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500</td>
<td></td>
</tr>
</tbody>
</table>

Thus, the maximum permissible exposure for general population/uncontrolled exposure at 902 MHz is 0.60 mW/cm². The power limit is a six-minute average.

The RF power density generated by the Encompass 4 Reader was calculated using a maximum antenna gain of 9.5 dBi, equivalent to the antenna gain of the external antenna.

**Warning**

*At 2 W transmitted power and a distance of 19.3 inches (49 cm) from the antenna, the maximum power density calculated was less than 0.60 mW/cm². Install the antenna at least 19.3 inches (49 cm) from the general public. Maintenance personnel must remain at least 8.66 inches (22 cm) from antenna when system is operating.*

The data confirms that the TransCore Encompass 4 Reader effectively meets OSHA requirements and thus does not represent an operating hazard to either the general public or maintenance personnel.

Introduction
Chapter 1
Introduction

This chapter is the introduction to this manual and provides information pertaining to the audience, organization, document conventions, system description, and license information for the Encompass® 4 Reader System.

Purpose

This guide provides site planning and testing, installing, and operating instructions for TransCore’s Encompass 4 Reader System, a dual-protocol reader that reads TransCore Super eGo® (SeGo), Intellitag®-based eGo, American Trucking Associations (ATA)/International Organization for Standardization (ISO), and Inter-Agency Group (IAG) tag protocols. Before you begin installing the Encompass 4 Reader System, TransCore recommends that you read this entire manual.

Audience

This document is intended to be used by authorized TransCore Encompass 4 Reader System dealers, installers, and service personnel. Because the Encompass 4 Reader System has no operator- or end-user serviceable components or features, no end-user manual or operator guide exists. Once the system is set up and tested by the authorized installer, Encompass 4 Reader System operation requires no end-user intervention.

System Guide Organization

Note: TransCore offers the Encompass 4 Reader in two models: one with an integrated antenna and one that requires connection to an external antenna. In this system guide, information and instructions for both Encompass 4 Reader models are presented. Where separate instructions dictate, a section detailing one Encompass 4 Reader model is followed immediately with a section detailing the other reader model. In this system guide, the reader with an integrated antenna is listed first. In cases where the information does not warrant a separate section, the addition of "...or antenna" distinguishes between the Encompass 4 Reader models.

The chapters of this guide and a description of the contents are listed below.

- Chapter 1, “Introduction,” explains the purpose and describes the audience for the guide, outlines the manual’s organization, provides a brief description of the Encompass 4 Reader system, and discusses Federal Communications Commission (FCC) licensing requirements.
• Chapter 2, “Developing the Site Plan,” discusses factors to be considered when developing the site plan and before ordering equipment and installing the Encompass 4 Reader System. These considerations include reader or antenna and tag alignment, site layout and traffic flow, and electrical and communications requirements.

• Chapter 3, “Choosing, Installing, and Removing Tags,” contains information on compatible tag models and provides procedures for installing tags onto, and removing tags from, vehicles that use the facility where the Encompass 4 Reader System is installed.

• Chapter 4, “Installing the Encompass 4 Reader System,” lists the materials needed and provides procedures to install the Encompass 4 Reader System. Steps include:
  • Pre-testing
  • Installing the Encompass 4 Reader System on a round pole or flat surface
  • Connecting power and communications
  • Marking the read zone.

• Chapter 5, “General Software Information,” and Chapter 6, “Communications Protocols,” provide reference information on various software-related topics and communications protocols.

• Chapter 7, “Commands,” discusses the host-transmitted commands that are used to control Encompass 4 Reader System configuration and operation.

• Chapter 8, “Configuring the Encompass 4 Reader System,” provides procedures for configuring and fine-tuning the Encompass 4 Reader System after installing it at the site.

• Chapter 9, “Troubleshooting and Maintenance,” answers the most commonly asked questions about installing and maintaining the Encompass 4 Reader System.

• Appendix A, “Glossary,” contains frequently used terms.

• Appendix C, “Wiring Tables,” shows the wiring connections for the communications interfaces, electrical cable connections, and the external interface signal wiring.

• Appendix D, “Command Quick Reference,” lists the Encompass 4 Reader System factory default configuration settings and provides host software commands in numerical and alphabetical order.

• Appendix E, “Compatible Tag Information,” provides helpful information about tags that are compatible with the Encompass 4 Reader System.

• Index provides an alphabetical listing of guide topics.
Typographical Conventions

The conventions listed in Table 1-1 are used in this manual:

Table 1-1 Typographical Conventions

<table>
<thead>
<tr>

</tbody>
</table>

System Description

The Encompass 4 Reader System is a dual-protocol reader supporting the low-cost, high-performance SeGo radio frequency identification (RFID) technology. SeGo technology provides the capability to read miniature RFID tags in a myriad of options including rugged, durable, or thin flexible forms such as the eGo Plus Sticker Tag. The Encompass 4 Reader System also supports legacy transportation applications such as gated toll, parking, or security gate access and is designed to be compatible with existing TransCore SmartPass® parking access control applications certified for licensed use. The Encompass 4 Reader System also supports the TransCore eGo and TransCore ATA/ISO tag types, as well as the IAG tag protocol.
The Encompass 4 Reader System is a high-power unit that can read both half-frame and full-frame tags. The reader output power can be adjusted using reader commands.

**Reader**

The Encompass 4 Reader System consists of an input/output (I/O) module, a power supply, a reader logic board (also called a tag decoder), a radio frequency (RF) transmitter/receiver (called the RF module), and a patch antenna.

A second version of the Encompass 4 Reader is designed to be used with a high-performance external antenna. These Encompass 4 Reader System components are contained in a highly reliable, compact, and easy-to-install environmentally-sealed package. Figure 1-1 shows the front and side views of an Encompass 4 Reader System.

![Encompass 4 Reader System Front and Side Views](image)

**Tags**

The Encompass 4 Reader System has the capability to read TransCore SeGo protocol tags, the Intellitag-based eGo protocol tags, TransCore ATA protocol, and TransCore ISO-compliant read-only full- and half-frame tags, as well as IAG protocol tags.

**How It Works**

The Encompass 4 Reader System directs the RF module to generate an RF signal, which is broadcast through the integrated or external antenna. Entering the Encompass 4 Reader System’s reading range, a TransCore RFID tag installed on a vehicle or other object to be tracked adds its programmed identification information to the signal and reflects the signal back to the Encompass 4 Reader System. The Encompass 4 Reader System receives this modified, or modulated signal, and decodes the tag data carried by the reflected signal and transmits this data to a local host computer for processing.
Licensing Requirements

An FCC license provides the user with the legal authorization to operate the Encompass 4 on the licensed frequencies at the site specified in the license. Only an authorized installer or service technician can set the RF frequency of the Encompass 4 Reader System to the frequency specified in the FCC site license. No end-user-operated controls exist on the Encompass 4 Reader System.

The FCC license may provide the user with protection and authorization to maintain the system should any other RFID product be used in the licensed area after the Encompass 4 equipment is installed.

Users of the Encompass 4 Reader System in the United States must obtain a license from the FCC. In the United States, the authorized modulated frequency band for this product is 911.75 to 919.75 MHz and the authorized continuous wave frequency band is 902.25 to 903.75 MHz and 910.00 to 921.50 MHz.

The user is responsible for filing the FCC license according to FCC regulations, but the TransCore dealer will provide assistance and support as necessary to complete these forms. Forms are available online at the FCC internet site http://wireless.fcc.gov/uls. For further information on obtaining the license contact TransCore.

Technical Support

Authorized dealers and distributors are responsible for the direct support of all customers. Authorized dealers and distributors needing technical support can contact:

Technical Support
Web: transcore.com/rfidsupport

or

TransCore
3410 Midcourt Road, Suite 102
Carrollton, Texas 75006 USA
Phone: (214) 461-4031
Fax: (214) 461-6478

Please be prepared to answer a series of questions that are designed to direct you to the best support resource available.
Developing the Site Plan
Chapter 2
Developing the Site Plan

This chapter discusses site plan development for installing the
Encompass® 4 Reader System.

Overview

Note: In this section, unless specifically stated, "Encompass 4 Reader" applies both to the Encompass 4 Reader with integrated antenna and Encompass 4 Reader with external antenna.

Developing a site plan provides the foundation for the site’s system design and establishes the following system configuration parameters:

• Number and general location of primary components
• Number of different radio frequencies required

Gathering relevant site information is crucial before applying for Federal Communications Commission (FCC) approval and ordering and installing Encompass 4 Reader(s) and tags.

Also, consider the following factors when developing a site plan:

• Type of tags used in the facility
• Reader and/or antenna and tag alignment
• Site layout and traffic flow
• Encompass 4 Reader and/or antenna mounting requirements
• Encompass 4 Reader electrical requirements
• Encompass 4 Reader communications requirements

These factors provide relevant information regarding each site’s physical and electromagnetic environment and the conditions under which the system must perform.

Reading of Mixed Population Tags

The Encompass 4 Reader reads TransCore’s Super eGo® (SeGo) protocol tags, the American Trucking Association (ATA) and International Organization for Standardization (ISO) read-only tags, whether powered by battery or beam, application-specific integrated circuit (ASIC)-based tags with Intellitag technology, or Inter-Agency
Group (IAG) tags. The reader can read the ATA or ISO read-only tags in the presence of Intellitag-based tags; however, attempting to read an Intellitag-based tag in the presence of an ATA or ISO read-only tag is not recommended.

**Caution**

*Attempting to read an Intellitag-based tag in the presence of an ATA or ISO read-only tag may provide unreliable results.*

The factors that influence the readability include, but are not limited to physical orientation and configuration, type of read-only tag, ratio of backscatter cross-section of the tags, and whether the tag is battery- or beam-powered.

**Reader and Tag Alignment**

The position of the Encompass 4 Reader and placement of the tag on the vehicle must be compatible. Also, consider any existing tagged vehicles now using the facility to determine the optimal Encompass 4 Reader location and orientation at the site.

**Note:** If any of the vehicles using your facility already have tags, such as those used in toll applications, contact TransCore for information about mixed-tag installations before you plan tag type, location, and programming.

Three primary criteria must be satisfied to achieve the highest read reliability:

- Polarization of the tag and the Encompass 4 Reader must be aligned in the same direction — both horizontal.
- The installed tag must be in a direct, unobstructed line of sight to the Encompass 4 Reader.
- Tags designed to be mounted in a vehicle windshield must be mounted in the vehicle’s windshield, and tags designed to be mounted on the exterior surface of the vehicle must be mounted on the exterior surface of the vehicle.

**Caution**

*A tag may not be reliably read unless the preceding criteria are met.*
Polarization

The polarization of the tag must be aligned in the same direction as the Encompass 4 Reader, as shown in Figure 2-1.

Note: Matching the tag and antenna polarization is critical to obtain optimal system performance.

Figure 2-1 Tag and Reader Orientation
Unobstructed Line of Sight

For optimum readability, install the Encompass 4 Reader and the vehicle’s tag so that when the vehicle approaches the Encompass 4 Reader, the tag is directly facing the reader and the line of sight is clear between the Encompass 4 Reader and the tag. If a fence or barrier is between the tag and the reader, the Encompass 4 Reader cannot reliably read the tags. Figure 2-2 illustrates possible installation locations of an Encompass 4 Reader in relation to a tag’s mounting location on a vehicle. If the tags are not in the recommended location, reliable optimum operation requires lower vehicle speeds.

Figure 2-2 Encompass 4 Reader Location Relative to Tag Position
If the Encompass 4 Reader is installed on a pole or wall to the left of the vehicle, optimal tag position is on the left side of the vehicle as illustrated in Figure 2-3.

![Figure 2-3 Typical Tag Positions for U.S. Driver’s Side Reader](image1)

If an Encompass 4 Reader is installed on a pole or wall to the right of the vehicle, optimal tag position is on the right side of the vehicle as illustrated in Figure 2-4.

![Figure 2-4 Typical Tag Positions for U.S. Passenger’s Side Reader](image2)
If the Encompass 4 Reader is installed in an overhead location, optimal tag position is in the top center of the windshield in the area behind the rear view mirror or on the vehicle’s front license plate or center bumper as illustrated in Figure 2-5.

![Figure 2-5 Typical Tag Positions Used with Overhead Reader](Image)

**Note:** Metallized coatings on some vehicle windshields and windows shield the RF energy emitted by the Encompass 4 Reader and may cause tags to be misread. Many metallized windshields have areas that are not metallized in which the tag can be placed and reasonable results achieved. If there are no openings in the metallized coating in which to install an interior tag, install exterior-type tags on the exterior of the vehicle.

Refer to Chapter 3 “Choosing, Installing, and Removing Tags” for more detailed information on tag positioning.

## Antenna Selection

This section contains guidelines that assist in antenna selection for an Encompass 4 Reader installation that uses an external antenna. The following antennas are compatible with the Encompass 4 Reader installation.

### AA3100 Yagi (without radome)

Appropriate for installations with the following requirements and conditions:

- 902 to 928 MHz operation
- Non-icing environments
- Relatively symmetrical reading range
- Antenna profile not a major consideration
AA3101 Yagi (with radome)
Appropriate for installations with the following requirements and conditions:
• 902 to 928 MHz operation
• Exposure to harsh environments
• Relatively symmetrical reading range
• Antenna profile not a major consideration

AA3110 Parapanel
Appropriate for installations with the following requirements and conditions:
• 902 to 928 MHz operation
• Exposure to harsh environments
• Broad radiation pattern in one dimension, narrow in the other
• Low antenna profile
• Horizontal polarization

AA3140 PCB Log Periodic
Appropriate for installations with the following requirements and conditions:
• 845 to 950 MHz operation
• Exposure to harsh environments
• Maximum coverage at close range (<20 ft [6.1 m])
• Vertical or horizontal polarization

AA3152 Universal Toll Antenna
Appropriate for installations with the following requirements and conditions:
• 902 to 928 MHz operation
• Exposure to harsh environments
• Broadcast pattern of similar size and shape in both horizontal and vertical planes
• Low antenna profile

Note: Do not use an AA3152 Universal Toll Antenna for side-fire application.
AA3153 Toll Antenna

Appropriate for installations with the following requirements and conditions:

- 902 to 928 MHz operation
- Exposure to harsh environments
- Broadcast pattern with virtually no side or back lobes, which helps confine coverage to a single lane width
- Low antenna profile

Antenna and Tag Alignment

The position of the antenna connected to the Encompass 4 Reader and placement of the tag on the vehicle must be compatible. Also, consider any existing tagged vehicles now using the facility to determine the optimal Encompass 4 Reader antenna location and orientation at the site.

Note: If any of the vehicles using your facility already have tags, such as those used in toll applications, contact TransCore for information about mixed-tag installations before you plan tag type, location, and programming.

Three primary criteria must be satisfied to achieve the highest read reliability:

- Polarization of the tag and the Encompass 4 Reader antenna must be aligned horizontally.
- The installed tag must be in a direct, unobstructed line of sight to the Encompass 4 Reader antenna.
- Tags designed to be mounted in a vehicle windshield must be mounted in the vehicle’s windshield, and tags designed to be mounted on the exterior surface of the vehicle must be mounted on the exterior surface of the vehicle.

Caution

A tag may not be reliably read unless the preceding criteria are met.

Polarization

The polarization of the tag must be aligned in the same direction as the antenna connected to the Encompass 4 Reader.

Note: Matching the tag and antenna polarization is critical to obtain optimal system performance.
Unobstructed Line of Sight

For optimum readability, install the Encompass 4 Reader antenna and the vehicle’s tag so that when the vehicle approaches the antenna, the tag is directly facing the antenna and the line of sight is clear between the antenna and the tag. If a fence or barrier is between the tag and the antenna, the antenna cannot reliably read the tags. Figure 2-2 illustrates possible installation locations of an Encompass 4 Reader antenna in relation to a tag’s mounting location on a vehicle. If the tags are not in the recommended location, reliable optimum operation requires lower vehicle speeds.

Site Layout and Traffic Flow

The following site layout and traffic flow considerations are critical when determining Encompass 4 Reader installation locations:

- The Encompass 4 Reader read zone
- Other Encompass 4 Reader units and antennas in the area
- Lane configurations
- Reflection, refraction, and diffraction of RF signals
- Existing signal interference at the site

The Encompass 4 Reader Read Zone

The Encompass 4 Reader must be able to read the tag data properly within a specified area, called the read zone, without reading other nearby tags or interfering with other Encompass 4 Readers at the site. The following are some of the factors that affect the size and shape of the read zone:

- Mounting method used (pole or wall mount)
- Mounting location (overhead or side mount)
- Height from the ground and mounting angle
- Mounting method used (pole or wall mount) of the antenna
- Mounting location (overhead or side mount) of the antenna
- Height from the ground and mounting angle of the antenna
- Indoor or outdoor location
- RF output attenuation
- Range discrimination setting
- Other sources of interference and reflection
The Encompass 4 Reader must be positioned to allow the RF signal to travel to and return from the tags within the designated range and be placed in an area where it is not likely to be bumped out of alignment. If the antenna becomes misaligned or some nearby structure is added or removed, system operation can be seriously affected.

The external antenna must be positioned to allow the RF signal to travel to and return from the tags within the designated range and be placed in an area where it is not likely to be bumped out of alignment. If the antenna becomes misaligned or some nearby structure is added or removed, system operation can be seriously affected.

For instructions on setting the read zone, see “Fine-Tuning and Verifying the Read Zone” on page 8-19.

### Other Encompass 4 Readers in the Area

Sites with more than one Encompass 4 Reader in proximity should have them configured with a frequency separation of at least 2 MHz from adjacent readers. If more than one Encompass 4 Reader is in a side-by-side or multiple lane application, the frequencies should be staggered. Also, Encompass 4 Readers may not operate accurately if they directly face each other or are positioned back-to-back.

If more than one Encompass 4 Reader and antenna is in a side-by-side or multiple lane application, the frequencies should be staggered. Also, Encompass 4 Readers may not operate accurately if the antennas directly face each other or are positioned back-to-back. Table 2-2 shows examples of staggered reader frequencies in a site with up to 14 readers.

**Table 2-1  Examples of Staggered Reader Frequencies**

### Lane Configurations

TransCore recommends that traffic be guided through a controlled lane to consistently obtain accurate tag readings and to prevent physical damage to the Encompass 4 Reader. The following subsections describe some common lane configurations and offer suggestions for positioning the Encompass 4 Reader within the controlled traffic flow.
**Gate with Center Island Configuration**

Figure 2-6 illustrates a typical gate application with the Encompass 4 Reader units positioned on a center island to read tags mounted on the inside windshield on the driver’s side (United States). The readers are placed to allow time for the gate to open so the vehicle can roll through without stopping while not allowing room for an untagged vehicle to be between the vehicle being read and the gate.

*Figure 2-6 Gate Application with Center Island*
Parking Garage with Ticket Island Configuration

Figure 2-7 illustrates a parking garage application with each Encompass 4 Reader mounted on the ticket island to read tags mounted on the inside center windshield or on the center front vehicle bumper. The Encompass 4 Reader placement may require the vehicle to stop before the gate opens.

Figure 2-7  Parking Garage Application

Overhead Reader Installation Configuration

Another option for Encompass 4 Reader placement is to mount it overhead in each lane as illustrated in Figure 2-8. This illustration assumes that tags are mounted on the inside center windshield or center bumper of the vehicle.
Developing the Site Plan

Figure 2-8  Overhead Installation

Lane Configurations for Encompass 4 Readers Using an External Antenna

TransCore recommends that traffic be guided through a controlled lane to consistently obtain accurate tag readings and to prevent physical damage to the Encompass 4 Reader and antenna.

Reflection, Refraction, and Diffraction of RF Signals

RF signals can be reflected, refracted, or diffracted by metal objects, walls, and even wet pavement or ice. Any of these factors can alter or degrade system performance. When designing your site plan, you must consider permanent structures and transient factors in the vicinity that may affect RF signals being generated by the Encompass 4 Reader. Permanent structures include buildings, chain link fences, guard shacks, and gates. Transient factors include passing traffic and local weather conditions, such as rain or snow. Symptoms of reflection, refraction, and diffraction include reading tags that are out of the desired read zone or tags being read from another lane.

The most common RF reflectors are metallic surfaces. RF signals may also be partially reflected by nonconducting materials such as dirt, wood, ice, asphalt, and concrete. When nonconducting materials in the system environment become wet, they increase reflection of RF signals.

The Encompass 4 Reader and/or antenna mounting location, aiming, and range control adjustment, and use of presence detectors can reduce interference from RF reflections. When these actions cannot adequately control reflections, other techniques such as shielding, absorbing, range sensitivity adjustment, or barriers can also be used. See Chapter 9, “Troubleshooting and Maintenance” for more information.
Existing Interference

Interference from RF and electrical sources can degrade system performance and must also be considered in the site design. Fluorescent lights, neon signs, nearby radio stations, or power lines can interfere with the optimal operation of the system. The magnetic impulse noise from relays that control gate opening and closing can also disrupt the RF signal.

Interference may degrade both reader and tag performance. Existing interference at the site may be shielded, removed, or positioned further from the Encompass 4 Reader and/or antenna. In some cases, changing the operating frequency of the Encompass 4 Reader may provide a simple solution. Readers in proximity should have at least a 2 MHz frequency separation. See “Other Encompass 4 Readers in the Area” on page 2-12. Strong RF sources of any frequency, in proximity to the tag, can preclude the tag receiving the reader interrogation. See Chapter 9, “Troubleshooting and Maintenance.”

Electrical and Communications Requirements

All construction work at the site must be completed before installing the Encompass 4 Reader. Electrical and communications cables should be installed according to all applicable local and federal building code requirements. Specific instructions for positioning and installing the Encompass 4 Reader are discussed in Chapter 4, “Installing the Encompass 4 Reader.”

Junction Box

Use a watertight junction box that meets applicable local and national building codes for connecting power and communications wiring. The junction box houses the terminal strip for power and communications connections. TransCore recommends a NEMA Type-4 junction box with a back mounting panel.

Power and Communications Cables

Cable length for power and communications depends on the physical characteristics of the Encompass 4 Reader installation site. Table 2-2 lists accessory kits available for cabling options based on your site’s requirements.

</tr>
<tr>
<td>20-1620-003</td>
<td>Connector kit only</td>
</tr>
</tbody>
</table>
Developing the Site Plan

Electrical Power

A dedicated electrical power supply must be present at the site and available to the Encompass 4 Reader at all times. The power must be 16-20V AC or 16-28V DC. A step-down transformer is available (North America only) to convert a 120V AC duplex wall outlet with ground to 18V AC, as is a step-up transformer to convert a low-voltage 12V AC outlet to 18V AC. Consult your local and national electrical codes for installation and safety requirements.

Note: Encompass 4 Readers installed outside North America require a locally supplied transformer.

If 18V AC or 18V DC power is available, the transformer option is unnecessary. TransCore offers a Class C transformer accessory kit (part number 76-1620-005) for sites where 110V AC is available. It is the installer’s responsibility to supply conversion equipment and wiring for other voltages. Table 2-3 contains power supply current requirements.

Table 2-3 Power Supply Current Requirements

<table>
<thead>

<tr>
<td>16 to 28V DC</td>
<td>1.7 A at 18V DC</td>
<td>1 A at 18V DC</td>
</tr>
</tbody>
</table>

Power circuits are protected internally against power surges.

Power Extension

Use Table 2-4 to determine the correct cable size according to the American Wire Gauge (AWG) standard for the necessary length of extension cable. The numbers in the first row of the table indicate cable size for the approximate cable length.

Note: If the cable is close to the maximum length, measure voltage at the Encompass 4 Reader with RF ON to ensure voltage does not drop below 16V. A drop in voltage below 16V causes a reduction in read range and possible damage to internal electronics as well as unreliable operation.

Your site design must include communications between the Encompass 4 Reader and a host computer. The Encompass 4 Reader communicates with the host computer through an asynchronous serial line or through a Wiegand interface. This serial line can be an RS–232 interface or an RS–422 interface. The host computer must be able to accept one of the interfaces shown in Table 2-5.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Number of Conductors</th>

<td>4</td>
</tr>
<tr>
<td>Wiegand</td>
<td>3</td>
</tr>
</tbody>
</table>
RS-232 Interface

Use an RS–232 interface if one or more of the following conditions apply to your site:

• The host computer system is 50 ft (15.2 m) or less from the Encompass 4 Reader.

• The host computer system is more than 50 ft (15.2 m) from the Encompass 4 Reader and a pair of RF modems or limited distance modem/line drivers over copper wire are used for communications between the Encompass 4 Reader and the host. The distance from the RF modem to the Encompass 4 Reader should not exceed 50 ft (15.2 m).

• Other common communications devices that can extend the RS–232 distance, such as fiber optic modems, have been selected.

The standard RS–232 connection maximum distance depends on the baud rate, cable type, and the RS–232 device at the other end.

RS-422 Interface

Use an RS–422 interface if one or more of the following conditions apply to your site:

• The host computer is more than 50 ft (15.2 m) from the Encompass 4 Reader.

• The host computer has an external limited-distance modem.

The standard RS–422 connection maximum distance depends on the baud rate, cable type, and the RS–422 device at the other end.

Wiegand Interface

The Encompass 4 Reader can interface with equipment requiring the Wiegand +5V DC data0-data1-ground interface. The reader uses the Wiegand interface included with the RS–232 or RS–422 option.

**Note:** The Encompass 4 Reader comes from the factory with either RS–232 and Wiegand or RS–422 and Wiegand. If you want to use Wiegand, you must first connect the Encompass 4 Reader using the RS–232 or RS–422 interface, set all necessary operating parameters in the reader, then set the Encompass 4 Reader’s configuration to Wiegand, and then connect the Encompass 4 Reader to the Wiegand interface.

**Note:** You must order tags programmed with Wiegand-formatted data when using a Wiegand-compatible reader.

Input/Output Circuits

To connect the Encompass 4 Reader to external equipment such as a treadle or traffic control light, install wires from these devices at the junction box. The Encompass 4 Reader input circuit is designed to connect to a dry contact closure. The Encompass 4 Reader output circuits are single-pole, double-throw relays providing dry contact closures. These contacts are rated at 42.2V AC peak (30Vrms) or 60V DC, at 1 A maximum with noninductive load.
Output circuits are not intended for the direct control of electromechanical devices such as motorized gates and barrier arms. For such applications, the Encompass 4 Reader output circuits should be used to drive a secondary, appropriately rated high-power relay.

**Antenna Interface**

The site design must include an interface cable between the Encompass 4 Reader and the compatible antenna chosen for the site. The antenna interface is RF coaxial cable with male Type N sockets on each end.

Table 2-6 is a summary of coaxial cable performance. Figures indicate maximum lengths of cable in feet.

**Table 2-6 Reader to Antenna Cable Performance**

<sup>a</sup> Suffixes 50, 50A, and 50B indicate 50-ohm cables available from the Andrew Corporation.

<sup>b</sup> These cable lengths ensure optimal system performance (1 dB loss).

<sup>c</sup> These cable lengths ensure adequate, but not optimal, system performance (3 dB loss).
Choosing, Installing, and Removing Tags
Choosing, Installing, and Removing Tags

This chapter describes the various tag types compatible with the Encompass® 4 Reader and the procedures for installing and removing compatible internal and external tags.

Compatible Tag Types

The Encompass 4 Reader provides the capability to read the various TransCore eGo® Plus-type tags employing Super eGo (SeGo) protocol and eGo-style tags and other American National Standards Institute (ANSI) ANSI INCITS 256-2001-compliant tags with Intellitag technology. Depending on options ordered, the Encompass 4 Reader can read eGo Plus and eGo tags as well as TransCore IT2000 (in optional ATA/ISO mode), ATA-protocol, ISO-compliant tags, and Inter-Agency (IAG) tags. It can also read tags formatted to a wide range of industry-standard proprietary formats, including SIA Wiegand 26-bit standard format.

See Appendix E for information about the numerous tag models.

Reader and Tag Model Interoperability

Table 3-1 lists the tags that are read by the Encompass 4 Reader. See www.transcore.com/pdf/Tag-Reader-Matrix.pdf for most current information concerning readers and supported tag protocols.

# the first "x" in the sticker tag listing defines which protocol is dominant (e.g., ATA or eGo/SeGo) in the tag; the second "x" further defines other active protocol configurations; and "nnn" is a unique identifier that differentiates between tags that are programmed similarly but that have different graphics or labels.

## the "x" in the security sticker tag listing defines which protocol is dominant (e.g., ATA or eGo/SeGo) in the tag; the "y" further defines other active protocol configurations; and "zzz" is a unique identifier that differentiates between tags that are programmed similarly but that have different graphics or labels.

### the "x" in the LPT listing determines whether the LPT is a standard eGo Plus LPT or a motorcycle version.

**eGo Windshield Sticker Tag**

The TransCore eGo WST (Figure 3-4) is offered to complete your Encompass 4 Reader System. It is a flexible sticker much like a vehicle registration sticker.
Choosing, Installing, and Removing Tags

### eGo License Plate Tag

The eGo LPT (Figure 3-5) is a water-resistant tag used in applications requiring an exterior-mounted tag.

### Installing eGo Plus Sticker Tags

eGo Plus Sticker Tags are designed to be attached by a semi-permanent adhesive to the interior surface of nonmetallic windshields 0.190 to 0.230 inches (4.82 to 5.84 mm) in thickness. For optimum performance, you must install the tag at least 2 inches (5 cm) from the metal in the windshield frame and 0.75 inch (1.9 cm) from the rear-view mirror support post. Detailed instructions for installing the eGo® Plus Sticker Tag are found in the pocket guide “Quick and Easy Installation Instructions for the eGo® Plus Sticker Tag.”

Some vehicles have a tinted area across the top of the windshield. If the tint is conductive, it can interfere with reading the tag. If a windshield has this conductive tint, the tag must be installed at least 2 inches (5 cm) below this tinted area.
Some vehicle windshields contain a metallic treatment that could prevent an interior windshield-mounted tag from being read. However, many of these metallized windshields have areas that are not metallized. On a vehicle without open areas in its metallized windshield, you might need to install an Encompass 4 Reader-compatible LPT on the vehicle. See the section “Installing eGo Plus License Plate Tags” on page 3-13. Contact TransCore for more information. See the section “Technical Support” on page 9-6.

### Required Materials

You need the following supplies to install an eGo Plus Sticker Tag:

- Glass cleaner, mild detergent and water, or any cleaning solution appropriate for your windshield
- Clean, dry cloth
- eGo Plus Sticker Tag

### Positioning eGo Plus Sticker Tags

TransCore designed the eGo Plus Sticker Tag to be installed on the upper center or upper corner portion of the windshield. Figure 3-6, Figure 3-7, and Figure 3-8 illustrate possible upper center tag placement locations. **If the upper portion of the windshield is tinted with an aftermarket conductive tint, use placement shown in Figure 3-7.**

**Mirror Post Attached on Windshield**

Choose this placement option as shown in Figure 3-6 if the mirror post is attached on the windshield.

![Figure 3-6 eGo Plus Sticker Tag Placement](image)

**Mirror Post Attached on Header**

Choose this placement option if the mirror post is attached on the header as shown in Figure 3-7 or if the upper portion of the windshield is tinted with a conductive tint.
Figure 3-7  eGo Plus Sticker Tag Placement

Large Truck with No Inside Mirror
Choose this option for a large truck that uses exterior mirrors only (Figure 3-8).

Figure 3-8  eGo Plus Sticker Tag Placement in Large Truck

eGo Plus Sticker Tag Installation Procedures

Caution
Confirm that the outside temperature is above 50°F (10°C). The sticker tag may not adhere correctly if the temperature is below this temperature.

To install the eGo Plus Sticker Tag
1. Determine the tag installation location for the vehicle using the placement guidelines in the section “Positioning eGo Plus Sticker Tags” on page 3-8.
2. Thoroughly clean the interior surface of the windshield behind and around the rearview mirror where the tag will be located.
3. Dry the tag location area thoroughly using a clean, dry cloth.
4. Remove the backing from the tag to expose the adhesive.
Encompass 4 Reader System Guide

Caution

Ensure that the tag is correctly located before touching it to the glass. Once the sticker tag is applied to the glass, it cannot be moved without damage to the tag.

5. Holding the sticker tag by its edges (Figure 3-9), position the tag in the correct area of the windshield (determined in Step 1), making sure the tag is oriented horizontally and is at least two inches (5 cm) from the windshield frame and 0.75 inch (1.9 cm) from the mirror post.

![Figure 3-9 Applying eGo Plus Sticker Tag to Windshield](image)

6. Press the sticker tag firmly against the glass and gently rub over the entire tag surface. Ensure that no air bubbles remain between the sticker tag and the windshield (Figure 3-10).

![Figure 3-10 Second Step of eGo Plus Sticker Tag Application](image)

Removing eGo Plus Sticker Tags

Peel the eGo Plus Sticker Tags from the windshield and clean any residue using isopropyl alcohol or commercial glass cleaner. The tag is inoperable once removed.
Installing eGo Plus Security Sticker Tags

An eGo Plus Security Sticker Tag is located in the same area on the windshield as the eGo Plus Sticker Tags. See “Positioning eGo Plus Sticker Tags” on page 3-8 for this information. The eGo Plus Security Sticker Tag is slightly less flexible than the eGo Plus Sticker Tag so the installation instructions differ. Detailed instructions for installing the eGo® Plus Security Sticker Tag are found in the pocket guide “Quick and Easy Installation Instructions for the eGo® Plus Security Sticker Tag.”

eGo Plus Security Sticker Tag Installation Procedures

Caution
Confirm that the outside temperature is above 50°F (10°C). The security sticker tag may not adhere correctly if the temperature is below this temperature.

To install the eGo Plus Security Sticker Tag
1. Determine the tag installation location for the vehicle using the placement guidelines in the section “Positioning eGo Plus Sticker Tags” on page 3-8.
2. Thoroughly clean the interior surface of the windshield behind and around the rearview mirror where the tag will be located.
3. Dry the tag location area thoroughly using a clean, dry cloth.
4. Remove the backing from the tag to expose the adhesive.

Caution
Ensure that the tag is correctly located before touching it to the glass. Once the security sticker tag is applied to the glass, it cannot be moved without damage to the tag.

5. Holding the sticker tag by its edges (Figure 3-11), position the tag in the correct area of the windshield (determined in Step 1), making sure the tag is oriented horizontally and is at least two inches (5 cm) from the windshield frame and 0.75 inch (1.9 cm) from the mirror post.
6. Press the security sticker tag firmly against the glass. Gently rub over the entire tag surface removing as much air from underneath the tag (Figure 3-12). The security sticker tag’s rigid case may prevent you from forcing out all of the air trapped between the tag and windshield. A minimal amount of air will not affect tag performance.

Removing eGo Plus Security Sticker Tags

Locate the tapered edge under the lower right corner of the eGo Plus Security Sticker Tags and carefully pull the tag from the windshield. If you cannot lift the tag using your fingers, insert a plastic scraper underneath the corner and lift the tag. Once you have removed the tag from the windshield, clean any residue using isopropyl alcohol or commercial glass cleaner. The tag is destroyed upon removal and cannot be reused.
Installing eGo Plus License Plate Tags

Metallized coatings on some vehicle windshields and windows absorb the RF energy emitted by the Encompass 4 Reader, thus causing tags to be misread. You must use exterior LPTs on vehicles with metallized coatings on their windshields and windows.

Use license plate installation techniques to install tags on the exterior of vehicles that have this type of window coating.

Note: The read zone of an overhead Encompass 4 Reader should be adjusted accordingly when an exterior tag is installed on a license plate, or the read zone will be reduced.

Required Materials

• Screwdriver (flat-blade or Phillips depending on the vehicle’s license plate mounting screws)
• Optional TransCore Exterior Tag Accessory Kit (19077-01). This kit contains tamper-resistant mounting screws and wrench.
• eGo Plus LPT

Positioning eGo Plus License Plate Tags

The eGo Plus LPT is installed over the license plate at the upper part of the vehicle’s front license plate area.

Note: If your state does not require a front license plate, install the LPT in the area where the license plate would normally be mounted. If your vehicle does not have a front license plate area, contact your tag agency for other tag options.

The orientation of the tag is important. The tag must be mounted so that the holes on the tag base plate are on the top edge.

eGo Plus LPT Installation Procedures

To mount the eGo Plus LPT

1. Remove the screws from the license plate area of your front bumper (Figure 3-13). If your vehicle does not have mounting screws you will need two self-tapping threaded screws. You can also contact the tag agency to inquire about the optional TransCore Exterior Tag Accessory Kit.

Note: You may need to use longer screws to fasten the LPT over the top area of your license plate.
Figure 3-13 Correct Mounting Location for LPT

2. Position the LPT so that it is within 18 inches (46 cm) of the center of the front bumper as shown by the shaded area in Figure 3-13. If your vehicle’s license plate mounting area is more than 18 inches (46 cm) from the center, you may need to select an alternate location to mount the tag. Contact your tag agency if your vehicle requires an alternate mounting location for the LPT.

3. Hold the LPT so that the etched lettering is facing you with the mounting holes to the top as shown in Figure 3-14.

Figure 3-14 Correct Tag Orientation

4. Fasten the LPT to the bumper using the license plate mounting screws (Figure 3-15). Install the LPT over the top area of the vehicle’s license plate if your vehicle has a front license plate. If your state does not require a front license plate, install the LPT in the area where a license plate would normally be mounted.
Installing eGo Windshield Sticker Tags

eGo WSTs are designed to be attached by a semi-permanent adhesive to the interior surface of nonmetallic windshields 0.190 to 0.230 inches (4.82 to 5.84 mm) in thickness. For optimum performance, you must install the tag at least 2 inches (5 cm) from the metal in the windshield frame and 0.75 inch (1.9 cm) from the rearview mirror support post. Detailed instructions are found in the pocket guide "Quick and Easy Installation Instructions for Windshield Sticker Tag."

Some vehicles have a tinted area across the top of the windshield. If the tint is conductive, it can interfere with reading the tag. If a windshield has this conductive tint, the tag must be installed at least 2 inches (5 cm) below this tinted area.

Some vehicle windshields contain a metallic treatment that could prevent an interior windshield-mounted tag from being read. However, many of these metallized windshields have areas that are not metallized. On a vehicle without open areas in its metallized windshield, you might need to install an Encompass 4 Reader-compatible LPT on the vehicle. See the section “Installing eGo Plus License Plate Tags” on page 3-13 and the section “Installing ATA License Plate Tags” on page 3-21. Contact TransCore for more information. See the section “Technical Support” on page 9-6.
**Required Materials**

You need the following supplies to install an eGo WSTs:

- Glass cleaner, mild detergent and water, or any cleaning solution appropriate for your windshield
- Clean, dry cloth
- eGo WST

**Positioning eGo Windshield Sticker Tags**

TransCore designed the eGo WST to be installed on the upper center or upper corner portion of the windshield. Figure 3-16, Figure 3-17, and Figure 3-18 illustrate possible upper center tag placement locations. **If the upper portion of the windshield is tinted with an aftermarket conductive tint, use placement Option B as shown in Figure 3-17.**

**Mirror Post Attached Low On Windshield**

Choose placement Option A shown in Figure 3-16 if the mirror post is attached low on the windshield.

![Option A](image)

**Figure 3-16 eGo Windshield Sticker Tag Placement Option A**

**Mirror Post Attached High on Windshield**

Choose placement Option B if the mirror post is attached high on the windshield as shown in Figure 3-17 or if the upper portion of the windshield is tinted with a conductive tint.
Choosing, Installing, and Removing Tags

Option B

Figure 3-17 eGo Windshield Sticker Tag Placement Option B

Mirror Post Attached to Headliner
Choose placement Option C if the mirror post is attached to the headliner as shown in Figure 3-18. If the upper portion of the windshield is tinted with an aftermarket conductive tint, place the tag two inches (5 cm) below the tinted area.

Option C

Figure 3-18 eGo Windshield Sticker Tag Placement Option C

Mounting the eGo Windshield Sticker Tag

Caution
Confirm that the outside temperature is above 50°F (10°C). The sticker tag may not adhere correctly if the temperature is below this temperature.

To install the eGo WST
1. Determine the tag installation location for the vehicle using the placement guidelines in the section “Positioning eGo Windshield Sticker Tags” on page 3-16.
2. Thoroughly clean the interior surface of the windshield behind and around the rearview mirror where the tag will be located.
3. Dry the tag location area thoroughly using a clean, dry cloth.
4. Remove the paper backing from the tag to expose the adhesive.

**Caution**

*Ensure that the tag is correctly located before touching it to the glass. Once the sticker tag is applied to the glass, it cannot be moved without damage to the tag.*

5. Holding the sticker tag by its edges, position the tag in the correct area of the windshield (determined in Step 1), making sure the tag is oriented horizontally and is at least two inches (5 cm) from the windshield frame and 0.75 inch (1.9 cm) from the mirror post.
6. Press the sticker tag firmly against the glass and gently rub over the entire tag surface. Ensure that no air bubbles remain between the sticker tag and the windshield.

**Removing eGo Windshield Sticker Tags**

Removing eGo WSTs requires the use of a plastic scraper or equivalent tool. The tag is inoperable once removed.

**Installing eGo LPT**

Follow the instructions presented in “eGo Plus License Plate Tag” on page 3-5 when installing an eGo LPT.

**Installing Interior ATA Tags**

Interior ATA-protocol tags are installed using hook-and-loop material or double-sided tape attached to the tag and to the windshield. When using hook-and-loop material, the loop material should be applied to the back of the tag and the hook material should be applied to the windshield. After the tag is installed, it can be removed easily and used in any vehicle that has corresponding hook material affixed to the windshield.

*Note:* Installing interior tags using double-sided tape results in a semipermanent attachment; the tag will be more difficult to remove than one installed using hook and loop material.

Interior ATA-protocol tags may be ordered from the factory with hook-and-loop material or double-sided tape already applied to the tag. The adhesive on this material is specially formulated for temperature extremes inside vehicles.

**Required Materials**

You will need the following materials to install interior tags:

- Rubbing alcohol or 50/50 isopropyl alcohol and water
Choosing, Installing, and Removing Tags

- Sponge and dry cloth
- Interior tags with two strips of factory-installed hook-and-loop material or factory-installed double-sided tape attached

Positioning ATA Tags

Interior ATA-protocol tags can be installed on the driver’s side, passenger’s side, or upper center of the vehicle’s windshield, depending on the Encompass 4 Reader’s position. See “Reader and Tag Alignment” on page 2-4.

Tags should be mounted consistently in all vehicles using a particular Encompass 4 Reader facility.

Interior Driver’s or Passenger’s Side

TransCore designed interior ATA-protocol tags for installation inside the vehicle, typically on the driver’s side of the windshield. Install the tag in the upper corner, at least two inches (5 cm) from the metal window post, as shown in Figure 3-19.

![Figure 3-19 Driver’s or Passenger’s Side (U.S.) Interior Windshield Tag Location](image)

Interior Center Windshield

You may also install ATA tags on the upper center portion of the windshield. Position the tag as closely as possible to the windshield’s upper center, behind the rearview mirror. The top edge of the tag should be approximately one inch (2.5 cm) below the base of the mirror, or above the base if enough room is available for the tag to be two inches (five cm) from metal around the windshield, as shown in Figure 3-20.
ATA Interior Tag Installation Procedures

Perform the following steps to install interior tags:
1. Clean the tag installation area on the interior surface of the windshield with rubbing alcohol.
2. Dry the area thoroughly using a clean, dry cloth.
3. Remove the clear backing from the two strips of hook-and-loop material on the back of the tag (Figure 3-21) or from the double-sided tape.
4. Position the tag over the correct area of the windshield, making sure that the tag and reader orientation are the same (horizontal or vertical).

5. Press the tag firmly against the glass.

**Removing Interior ATA Tags**

To remove an interior ATA-protocol tag installed using hook-and-loop material, simply pull the tag away from the windshield.

To remove an interior ATA-protocol tag installed using double-sided tape, slowly pry off the tag with a thin tool, such as a putty knife.

**Installing ATA License Plate Tags**

Metallized coatings on some vehicle windshields and windows absorb the RF energy emitted by the Encompass 4 Reader, thus causing tags to be misread. Use exterior LPTs on vehicles with metallized coatings on windshields and windows.

Use license plate installation techniques to install tags on the exterior of vehicles that have this type of window coating.

**Note:** The read zone of an overhead Encompass 4 Reader should be adjusted accordingly when an exterior tag is installed on a license plate, or the read zone will be reduced.

Exterior tags may be installed on metal or plastic bumpers using the existing license plate bracket and hardware.

The tag can be mounted on the front bumper where the license plate is normally located or mounted directly to the front license plate or license plate bracket. Once installed, the face of the tag should be pointing directly forward or slightly upward. If the bumper, license plate, or license plate bracket has any material that overhangs the tag, the tag will not function properly.

**Required Materials**

You need the following supplies to install license-plate mounted tags:

- Exterior LPT
- Two 0.25-inch (.63 cm) bolts and nuts (user-supplied). Length of the bolts can vary depending on vehicle model.
- Screwdriver and wrench (user-supplied)
- 0.25-inch (.63 cm) spacers or washers (if needed). Thickness of spacers can vary depending on vehicle model.
Positioning ATA License Plate Tags

The orientation of the tag is important. The tag must be mounted so that the holes on the tag base plate are on the bottom edge. See Figure 3-22.

Figure 3-22  Proper Tag Orientation

When positioning the tag, observe the following guidelines:

- The tag should be horizontal and parallel to the ground.
- The tag face should be perpendicular or tilted slightly upward.
  - The tag may lean to the rear a maximum of 30 degrees.
  - The tag may lean to the front a maximum of 10 degrees.

ATA License Plate Tag Installation Procedures

To mount the LPT

1. Position the tag so that the holes in the tag are on the bottom edge and the tag is within 18 inches (.45 m) of the center of the front bumper as illustrated by the shaded area in Figure 3-23.

   Note: When mounting an exterior tag on heavy trucks or tractors, the tag must be mounted within 1.5 inches (3.81 cm) of the top of the bumper.
Figure 3-23 Correct Exterior Tag Placement

2. Line up the holes in the tag as follows:
   - If mounting the tag to a license plate or license plate bracket, line up the holes in the tag to the upper holes of the license plate or license plate bracket.

   \textit{Note: Do not} mount the tag to the bottom holes of the license plate or license plate bracket. The reflective material on the license plate may interfere with the proper functioning of the tag.
   - If mounting the tag to the bumper, line up the holes in the tag with the holes in the front bumper where the license plate would normally be located. See Figure 3-23.

3. Insert bolts through the tag base plate holes and the holes in the bumper or the holes in the upper portion of the license plate area. See Figure 3-24.
Encompass 4 Reader System Guide

Figure 3-24  Upper Placement In License Plate Area

4. Make sure the area within 45 degrees of the center of the tag is free of obstructions. See Figure 3-25.

Figure 3-25  Obstruction-Free Area

5. Make sure that no material overhangs the tag. If overhang is more than ½ inch (1.27 cm), insert spacers or washers directly behind the tag so that the tag is clear of any overhanging obstruction. Secure the bolts with a nut. See Figure 3-26.
Choosing, Installing, and Removing Tags

6. Tighten the bolts and nuts with a screwdriver and wrench to secure the tag to the vehicle.

Types of Bumpers

When mounting tags directly to a bumper, consider the following factors:

- Tags can be mounted on any metal or non-metallic surface; composition of bumper does not matter.
- Tags can be mounted to plastic bumpers using self-threading screws.
- Metal bumpers should be pre-drilled; self-threading screws may be used.

Alternate Mounting Locations

If the exterior type tag cannot be mounted on the license plate bracket or directly on the bumper, it may be mounted on a relatively vertical front surface of the vehicle. The exterior tag should be mounted as close to the bumper as possible, following all guidelines regarding orientation, obstruction, and overhang given for bumper mounting. For applications where the integrity of the mounting surface cannot be compromised, the exterior tag can be mounted on a smooth flat surface using double-sided tape.

Required Materials

Exterior tags need to be installed on a relatively flat surface. You need the following materials to install exterior tags:

- Rubbing alcohol, 50/50 isopropyl alcohol and water, or solvent/cleaner for metal
- Sponge and dry cloth
- Exterior tag with the double-sided adhesive tape attached
**Installation Procedures Using Tape**

To install the tag on a metal or plastic bumper

1. Clean and degrease the tag installation area of the vehicle bumper with solvent/cleaner.
2. Dry the area thoroughly using a clean, dry cloth.
3. Remove the backing from the double-sided tape on the back of the tag, as shown in Figure 3-27.

![Figure 3-27 Exterior Tag with Double-Sided Tape](image)

4. Position the tag over the installation area, making sure that the tag and Encompass 4 Reader are horizontally polarized.
5. Press the tag firmly against the bumper.

**Installation Procedures Using Blind Rivets**

To install an exterior tag using blind rivets through the tag’s installation tabs

1. Position the tag on the bumper in the installation area and mark the hole positions of the tag’s installation tabs on the bumper.
2. Follow the rivet manufacturer’s instructions to drill holes in the bumper for rivets.
3. If the rivet head is smaller than the tag installation holes and can be pulled through the holes, use a small washer to secure the rivet through the tag.

**Removing Exterior Tags**

To remove an exterior tag installed with rivets, follow the rivet manufacturer’s instructions to remove the rivets.
Installing the Encompass 4 Reader
Chapter 4

Installing the Encompass 4 Reader

This chapter lists the materials needed and presents the procedures to pre-test and install the Encompass® 4 Reader.

Installation Process

Note: In this section, unless specifically stated, "Encompass 4 Reader" applies both to the Encompass 4 Reader with integrated antenna and Encompass 4 Reader with external antenna.

After you have developed the site plan and identified the location to install the Encompass 4 Reader and antenna1, if required, you are ready to install the equipment. Installation involves the following tasks:

• Pre-installation testing of Encompass 4 Reader power and tag read capability
• Mounting the Encompass 4 Reader, and antenna if required, on a pole, ceiling, or wall
• Connecting the antenna
• Connecting the Encompass 4 Reader power
• Marking the read zone
• Connecting the Encompass 4 host and sense input/sense output and communications

Materials Supplied by TransCore

You need the following materials to pre-test and install the Encompass 4 Reader. TransCore supplies some of the materials; other materials must be obtained from other sources.

Contents of Shipping Carton

Ensure that you have received all parts before beginning your pre-installation Encompass 4 Reader tests. Your Encompass 4 Reader is packaged with the following materials:

1. The Encompass 4 Reader is designed with an integrated patch antenna or with a RF cable connector for use with an external antenna. Unless noted in the text, "antenna" refers to an "external antenna."
• One Encompass 4 Reader
• One mounting bracket and the mounting hardware
• One Encompass 4 Reader Quick Start Guide
• Any accessories ordered as options as shown in Table 4-1

Required accessories are a power/communications cable harness and a 110V AC wall transformer or a 12V AC to 18V AC step-up transformer. If you are using an antenna with the Encompass 4, you also require an Encompass 4 Reader-compatible antenna and an antenna RF interface. These may be ordered as accessories from TransCore or obtained from other sources.

**Installation Accessory Options**

Table 4-1 lists optional TransCore Encompass 4 Reader installation accessory items.

**Table 4-1 Installation Accessories**

</table>

*Note:* The Encompass 4 Reader may be ordered with a multwire cable harness (part number 58-1620-001 or 58-1620-002 in Table 4-1) as a separate accessory. One end has a waterproof connector for the Encompass 4 Reader, and the other end has 13 pairs of color-coded wires.

**Additional Materials Needed for Testing**

You need these additional materials to perform the pre-tests on the Encompass 4 Reader:

• Test tags, supplied by the TransCore dealer or distributor
• Suitable 18V AC or 18V DC power wiring for the Encompass 4 Reader
• Audible circuit tester and 9V DC battery for circuit tester power
Installing the Encompass 4 Reader

- Wire stripper
- One Encompass 4 Reader-compatible antenna (if required)
- Suitable RF interface coaxial cable (if using antenna)

Pre-installation Testing of the Encompass 4 Reader

Before installing the Encompass 4 Reader permanently at the site, you should use an audible circuit tester to confirm that the Encompass 4 Reader has power and can read a tag presented in the tag read zone.

Testing the Encompass 4 Reader Using an Audible Circuit Tester

An audible circuit tester is also called a buzz box. These boxes are available at some electronic parts supply stores, or you can make a buzz box, as shown in Figure 4-1. The buzz box is powered by a 9V DC battery and is equipped with two alligator-clip leads. When you touch the leads together, the box makes an audible sound.

![Figure 4-1 Wiring for Audible Circuit Tester](image)

**Figure 4-1 Wiring for Audible Circuit Tester**

To test the Encompass 4 Reader that uses an integrated antenna, connect the power supply as described in the appropriate section below, and then test as described in the section “Bench Testing the Encompass 4 Reader Before Installation” on page 4-10.

To test the Encompass 4 Reader that uses an external antenna, connect the antenna and power supply as described in the appropriate section below, and then test as described in the section “Bench Testing the Encompass 4 Reader Before Installation” on page 4-10.
Connecting the Antenna
Use these instructions to connect the Encompass 4 Reader and antenna.

**Caution**
To avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.

To connect the reader and antenna
1. Ensure the reader is turned off and unplugged.
2. Connect one end of the RF interface cable to the antenna.
3. Connect the other end of the RF interface cable to the antenna connector on the back of the Encompass 4 Reader. See Figure 4-2.

Connecting the AC Power Supply

**Caution**
If you are using an external antenna, to avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.

To connect the Encompass 4 Reader to a low-voltage AC power supply
1. Connect the Encompass 4 power wires from the cable to the transformer using the color coding as described in Table 4-2.

**Table 4-2 AC Transformer Connections for Colored-Wire Pair Cable**

<table>
<thead>

Connecting Communications for Bench Testing

TransCore offers reader models that communicate through RS–232, RS–422, and Wiegand interface protocols. This section describes the procedures and materials required for connecting the communications to perform pre-installation bench testing of the Encompass 4 Reader.

Required Materials

You need the following materials to connect the communications cable to the PC:

- PC or laptop
- Any terminal emulation program such as Procomm Plus™ or Hyper Terminal™ running on a PC
- Communications cable to connect to the COM1 port on your PC

Encompass 4 Reader communications and customer interface signals are supplied from the Encompass 4 Reader to the host through a multiwire cable, which is a 13-pair pigtail. The connector for this cable is located on the back of the Encompass 4 Reader. Refer to the following sections to connect the appropriate communications wires from the cable to the PC.
These sections contain instructions for connecting RS–232 and RS–422 communications between the Encompass 4 Reader and the PC for bench testing purposes. Each section contains wiring instructions and pin assignments followed by step-by-step connection procedures.

The Encompass 4 Reader can remain powered up while connecting reader-to-host PC communications.

**Connecting for Bench Testing with RS–232 Interface**

RS–232 interface signals are supplied by three or five wires from the Encompass 4 communications cable. The pin assignments for the signal to the host male DB9 and DB25 connectors are shown in boldface in Figure 4-3.

![DB9 Male Pin Connector](image)

![DB25 Male Pin Connector](image)

*Figure 4-3 Pin Assignments for Signal to Host Connectors*

*Note: In Figure 4-3 supported pin assignments are in boldface.*
Connecting the Encompass 4 Reader Colored-Wire Pair Cable

Table 4-4 shows the RS–232 colored wire assignments.

Table 4-4  RS–232 Interface Signal Wiring for Colored-Wire Pair Cable

<td>Pin 8</td>
</tr>
<tr>
<td>CTS — Encompass 4 Reader sense input, host sense output</td>
<td>Red</td>
<td>Pin 7</td>
<td>Pin 4</td>
</tr>
</tbody>
</table>

To connect the colored-wire cable using RS–232 interface

1. Connect the black wire (transmit data) from the red and black wire pair to pin 2 of the DB9 connector or pin 3 of the DB25 connector.
2. Connect the red wire (receive data) from the red and black wire pair to pin 3 of the DB9 connector or pin 2 of the DB25 connector.
3. Connect either the yellow or black wire (signal ground) from the yellow and black wire pair to pin 5 of the DB9 connector or pin 7 of the DB25 connector.
4. Plug the DB9 connector or DB25 connector into the PC.

If the host is set up for hardware handshaking, use the following procedures:
1. Connect the yellow wire (RTS) from the yellow and red wire pair to pin 8 of the DB9 connector or pin 5 of the DB25 connector.

2. Connect the red wire (CTS) from the yellow and red wire pair to pin 7 of the DB9 connector or pin 4 of the DB25 connector.

**Connecting for Bench Testing with RS–422 Interface**

RS–422 interface signals are supplied by four wires from the Encompass 4 Reader communications cable. Your host must have an RS–422 interface with either an internal or external converter.

*Note:* For temporary bench testing purposes only, you will need to connect the RS–422 interface signal wires by following the pin-outs of your interface device. For permanent installations, follow the RS–422 connection instructions on page 4-25.

---

**Bench Testing the Encompass 4 Reader Before Installation**

The Encompass 4 Reader is set to read the tag protocol(s) programmed into your reader.

*Note:* Test tags should match the protocol(s) selected for your reader. These tags can be ATA-protocol, ISO-compliant tags, or Inter-Agency Group tags affixed to a plastic or wooden yardstick, or eGo Plus Sticker Tag or eGo Windshield Sticker Tags (WSTs) affixed to a piece of nonmetallic windshield-type glass 0.190 to 0.230 in (4.82 to 5.84 mm) in thickness. The eGo and eGo Plus sticker tags have a reduced read range when not attached to glass.

**To test that the Encompass 4 Reader has power and can read a tag presented in the read zone**

1. Confirm that the Encompass 4 Reader colored-wire pair cable is correctly connected to a suitable AC or DC low-voltage power supply as discussed on page 4-6 and page 4-7 and that the transformer is connected to a power outlet.

2. If you are using an external antenna, confirm that the antenna is connected to the Encompass 4 Reader.

*Caution*

*To avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.*

2. Confirm that the Encompass 4 Reader colored-wire pair cable communications are connected correctly as described in the section “Connecting Communications for Bench Testing” on page 4-7.

3. Connect the two leads from the audible circuit tester to the white and red wire pair (pair #8, lock/lock return) from the Encompass 4 Reader power/communications cable.
4. Start the terminal emulation application Microsoft HyperTerminal by selecting Programs>Accessories>Communications>HyperTerminal and press ENTER.

5. In the HyperTerminal dialog boxes choose the com port to which the communications interface is attached and set the properties as:
   - Bits per second: 9600 baud
   - Data bits: 8
   - Parity: none
   - Stop bits: 1
   - Flow control: none

6. Cycle the power on the Encompass 4 Reader and ensure that the sign-on message displays.

7. Input the following commands in the order provided in Table 4-5. Commands include those to switch to command mode, set radio frequency (RF), turn on RF, and return the reader to data mode.

   Table 4-5 Commands for Bench Testing

<td>Returns Encompass 4 Reader to data mode.</td>
</tr>
</tbody>
</table>

8. Pass the correct test tag for your reader application in front of the Encompass 4 Reader or antenna. The audible circuit tester should sound a tone when the tag is read. If no tone sounds, ensure that steps 1, through 5 were performed correctly and that you are using a compatible tag. Repeat steps 6 and 7. If no tone sounds, contact TransCore (see “Technical Support” on page 9-6).

9. Disconnect the circuit tester from the Encompass 4 Reader power/communications cable.

10. Disconnect the power and communications connections made for pre-installation testing.

   Note: You will need the audible circuit tester again to determine the read zone when installing the Encompass 4 Reader at the site.
Mounting the Encompass 4 Reader

This section lists procedures and materials required for mounting the Encompass 4 Reader on a round pole or on a ceiling, wall, or other flat surface based on the site’s requirements.

In permanent installations using an antenna, the Encompass 4 Reader should be positioned as close as possible to the antenna. Long cable runs increase system sensitivity to noise. See Table 2-6 on page 2-20 for maximum RF cable lengths.

Mounting the Encompass 4 Reader on a Round Pole

The Encompass 4 Reader can be simply and inexpensively mounted on a round pole. The pole must be a minimum of 2 inches (5 cm) in diameter and should extend approximately 8 feet (2.4 m) above the pavement level. The pole must be installed according to local building codes.

Required Materials To Be Supplied by Customer

You need the following materials to mount the Encompass 4 Reader on a round pole:

- A 5/32-inch Allen wrench to assemble and adjust the mounting brackets
- Two 0.5 inch (1.3 cm) wide, stainless steel hose clamp straps that are 12 inches (30.5 cm) long for a typical 2-inch (5-cm) diameter pole or 24 inches (61 cm) long for a 10-inch (25-cm) diameter pole
- Flat-tip screwdriver or adjustable wrench to tighten hose clamp straps

Procedures

To mount the Encompass 4 Reader to a pole

1. Unpack the Encompass 4 Reader. A factory-mounted bracket (Figure 4-4 and Figure 4-5) is attached to the back of the Encompass 4 Reader. A pole mount bracket assembly (Figure 4-6) is bubble-wrapped separately and contains a plastic bag of four Allen screws and washers.

2. Using the two 0.5 inch (1.3 cm) stainless steel hose clamps, attach the pole mount bracket assembly to the pole approximately 8 feet (2.4 m) above the pavement surface. Tighten slightly so you can adjust the Encompass 4 Reader left or right, but not so slightly the straps slide down the pole.
3. Using the four Allen screws and washers, attach the Encompass 4 Reader to the pole mount bracket as shown in Figure 4-7. Tighten the screws slightly so
that the Encompass 4 Reader can be adjusted up or down, but not so slightly the mounting assembly slips.

Figure 4-7 The Encompass 4 Reader Attached to the Pole Mount Bracket

4. Adjust the assembly by pointing the Encompass 4 Reader to the middle of the area where tags will be read, and tighten all screws and straps slightly.

*Note:* Adjust the Encompass 4 Reader to provide the most direct line of sight to the tags.

Figure 4-8 illustrates front and top views of a pole-mounted Encompass 4 Reader with the approximate measurements for sites where tags would be mounted on the interior driver-side windshield. eGo WSTs may be mounted on the interior upper center or upper corner of the windshield, eGo Plus Sticker and Security Sticker tags may be mounted on the interior upper center of the windshield.

*Note:* Determine the read zone before you tighten all screws and straps permanently. Refer to the section “Marking the Read Zone” on page 4-29.
Figure 4-8  Front and Top Views of the Encompass 4 Reader Position

**Note:** The dimensions in Figure 4-8 are for demonstration purposes only and are approximations for sites using the older ATA-type tags. Actual dimensions vary as lane geometry and tag style varies from site to site. Adjust the Encompass 4 Reader matching site and tag mounting positions to provide the most direct line of sight to the tags.

**Caution**
Connect the reader bracket to earth ground using a ground cable and stake. TransCore recommends that you follow the National Electric Code for lightning protection for the locale where you are installing the Encompass 4 Reader.
Mounting the Encompass 4 Reader to a Wall or Flat Surface

The basic Encompass 4 Reader is supplied with a pole-mount bracket assembly (Figure 4-6) that allows you to adjust the Encompass 4 Reader up and down. TransCore recommends using the wall-mount bracket accessory kit (Figure 4-9) in addition to the pole-mount bracket to provide additional horizontal aiming flexibility when attaching the Encompass 4 Reader to a pole with flat sides or to a wall or ceiling where other structures can interfere with accurately aiming the Encompass 4 Reader toward the tags.

Figure 4-9  Wall Mount Bracket Accessory (part number 54-1620-001)

Required Materials

You need the following materials to install the Encompass 4 Reader on a wall or flat surface. Ensure the use of high-quality, corrosion-resistant anchor hardware.

- Anchor hardware suitable for the surface on which you mount the Encompass 4 Reader
  
  Because the Encompass 4 Reader weighs only 9 1/2 lbs (4.3 kg), 0.25 in (0.6 cm) bolt hardware is adequate to secure the unit to a wall or ceiling.
  
- Four hex nuts 3/8-16 threaded and four lockwashers
  
- 5/32-inch Allen wrench
  
- One Encompass 4 wall mount bracket accessory kit (required)

Procedures

To mount the Encompass 4 Reader to a wall or ceiling

1. Unpack the Encompass 4 Reader. Set aside the pole mount bracket.
Use the bracket in the remaining steps to provide greater adjustment for the Encompass 4 Reader. The pole-mount bracket is wrapped separately from the Encompass 4 Reader and contains a plastic bag of four Allen screws and washers.

2. Using the 5/32-inch Allen wrench, remove the factory-mounted bracket attached to the back of the Encompass 4 Reader. Remove all four Allen screws and lock washers from the bracket and set aside.

3. Unpack the wall-mount bracket accessory kit.

4. Using the Allen screws and lock washers set aside in Step 2, attach the wall-mount bracket to the back of the Encompass 4 Reader, as shown in Figure 4-10.

5. Tighten the screws to secure the bracket.

6. Using the four screws and washers supplied with the wall-mount bracket, attach the factory-mounted bracket to the wall mount bracket, lining up the four outside screw holes as shown in Figure 4-11.
7. Tighten lightly, since you will want to adjust the bracket later. This subassembly allows you to aim the Encompass 4 Reader left or right when all three brackets are assembled.

8. Mount the pole-mount bracket to the wall, ceiling, or fixture using appropriate anchors as shown in Figure 4-12.

**Figure 4-11 Factory-Mounted Bracket Attached to Wall Mount Bracket**

**Figure 4-12 Pole Mount Bracket Attached to Wall**
9. Mount the Encompass 4 Reader to the pole-mount bracket using Allen screws, as shown in Figure 4-13.

![Figure 4-13 Connecting the Encompass 4 Assembly to Pole Mount Bracket](image)

10. Adjust the assembly by pointing the Encompass 4 Reader to the middle of the area where tags will be read and tighten all screws and straps slightly.

**Note:** Adjust the Encompass 4 Reader to provide the most direct line of sight to the tags.

**Caution**

*Connect the reader bracket to earth ground using a ground cable and stake.*

*TransCore recommends that you follow the National Electric Code for lightning protection for the locale where you are installing the Encompass 4 Reader.*

After mounting the Encompass 4 Reader, you must connect it to a dedicated 16 to 20V AC or 16 to 28V DC power supply.

**Caution**

*To avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.*
Mounting the Antenna

If you are using the Encompass 4 Reader that requires an external antenna in permanent installations, the antenna should be positioned as close as possible to the Encompass 4 Reader. Long cable runs increase system sensitivity to noise. See Table 2-6 on page 2-20 for maximum RF cable lengths.

This section provides guidelines for mounting antennas.

Note: Do not use an AA3152 Universal Toll Antenna for side-fire application.

Mounting the Antenna Curb-Side

Some site designs, for example those with curb-side antennas, require that the antenna be mounted on a round pole. The pole must be a minimum of 2 inches (5 cm) in diameter and should extend approximately 8 feet (2.4 m) above the pavement level. The pole must be installed according to local building codes.

Procedures

Use the following guidelines to mount an antenna on a curb-side round pole.

To mount the antenna to a curb-side pole
1. Follow the manufacturer’s directions to attach the antenna assembly to the pole approximately 8 feet (2.4 m) above the pavement surface.
2. Tighten slightly so that you can adjust the antenna left or right but not so slightly that the antenna slides down the pole.
3. Adjust the assembly by pointing the antenna to the middle of the area where tags will be read, and while in this position, tighten all screws and fastenings slightly.

Note: Adjust the antenna to provide the most direct line of sight to the tags.

Figure 4-14 illustrates front and top views of a pole-mounted antenna with the approximate measurements for sites where tags would be mounted on the interior driver-side windshield.

Note: Determine the read zone before you tighten all screws and straps permanently. Refer to the section “Marking the Read Zone” on page 4-29.

After mounting the antenna, you must connect it to the Encompass 4 Reader. Follow the procedures described previously in the section “Connecting the Antenna” on page 4-6.

Caution

To avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.
Installing the Encompass 4 Reader

Figure 4-14 Front and Top Views of the Curb-Side Antenna Position

Note: The dimensions in Figure 4-14 are for demonstration purposes only and are approximations for sites using the older ATA-type tags. Actual dimensions vary as lane geometry and tag style varies from site to site. Adjust the antenna to match site and tag mounting positions to provide the most direct line of sight to the tags.

Mounting the Antenna Overhead

Some site designs require that the antenna be mounted in an overhead location.

Procedures

To mount the antenna in an overhead location
1. Follow the manufacturer’s directions to attach the antenna assembly to the overhead location at approximately 18 feet above the pavement surface.
2. Tighten slightly so that you can adjust the antenna up and down but not so slightly that there is a risk of the antenna falling.

3. Adjust the assembly by pointing the antenna to the middle of the area where tags will be read, and while in this position, tighten all screws and fastenings slightly.

    *Note: Adjust the antenna to provide the most direct line of sight to the tags.*

For example, in toll lanes the Universal Toll Antenna (UTA) would be installed approximately 15 degrees from the vertical.

*Figure 4-15* illustrates an overhead-mounted antenna with approximate measurements for the read zone.

![Figure 4-15 Encompass 4 Reader Installation with Overhead Antenna](image)

*Figure 4-15 Encompass 4 Reader Installation with Overhead Antenna*

*Note: Determine the read zone before you tighten all screws and straps permanently. Refer to the section “Marking the Read Zone” on page 4-29.*

After mounting the antenna, you must connect it to the Encompass 4 Reader. Follow the procedures described previously in the section “Connecting the Antenna” on page 4-6.

### Connecting the Power Supply

To connect the Encompass 4 Reader to a low-voltage AC power supply follow the procedures described previously in the section “Connecting the AC Power Supply” on page 4-6.
Installing the Encompass 4 Reader

To connect the Encompass 4 Reader to a low-voltage DC power supply follow the procedures described previously in the section “Connecting the DC Power Supply” on page 4-7.

After mounting the Encompass 4 Reader and antenna, if required, you must connect the reader to a dedicated 16 to 20V AC or 16 to 28V DC power supply.

**Caution**
*To avoid damage to the Encompass 4 Reader, you must connect the antenna before applying power to the reader.*

---

## Connecting Communications

TransCore offers reader models that communicate through RS–232, RS–422, and Wiegand interface protocols. This section describes the procedures and materials required for connecting the communications to the junction box and to the sense input and sense output circuits.

### Required Materials

You need the following materials to connect the communications cable to the PC:

- PC or laptop
- Any terminal emulation program such as Procomm Plus™ or Hyper Terminal™ running on a PC
- Communications cable to connect to the COM1 port on your PC

### Connecting the Encompass 4 Reader to the PC

Encompass 4 Reader communications and customer interface signals are supplied from the Encompass 4 Reader to the host through a multiwire cable, which is a 13-pair pigtail. The connector for this cable is located on the back of the Encompass 4 Reader. Refer to the following sections to connect the appropriate communications wires from the cable to the terminal strip that is located inside the junction box.

These sections contain instructions for connecting RS–232, RS–422, and Wiegand communications between the Encompass 4 Reader and the PC. Each section contains wiring instructions and pin assignments followed by step-by-step connection procedures.

The Encompass 4 Reader can remain powered up while connecting reader-to-host PC communications.

**RS–232 Interface**

RS–232 interface signals are supplied by three or five wires from the Encompass 4 Reader communications cable. The pin assignments for the signal to the host male DB9 and DB25 connectors are shown in boldface in Figure 4-3.
Connecting the Encompass 4 Reader Colored-Wire Pair Cable

Table 4-6 shows the RS–232 colored wire assignments.

Table 4-6  RS–232 Interface Signal Wiring for Colored-Wire Pair Cable

<table>
<thead>
<tr>
<th>Signal from Encompass 4 Reader</th>
<th>Colored-Wire Pair Cable</th>
<th>Connect Wire to Host DB9 Pin</th>
<th>Connect Wire to Host DB25 Pin</th>

<td>Yellow</td>
<td>Pin 8</td>
</tr>
<tr>
<td>CTS — Encompass 4 Reader sense input, host sense output</td>
<td>Red</td>
<td></td>
<td>Pin 7</td>
</tr>
</tbody>
</table>

To connect the colored-wire cable using RS–232 interface

1. Connect the black wire (transmit data) from the red and black wire pair to pin 2 of the DB9 connector or pin 3 of the DB25 connector.

2. Connect the red wire (receive data) from the red and black wire pair to pin 3 of the DB9 connector or pin 2 of the DB25 connector.

3. Connect either the yellow or black wire (signal ground) from the yellow and black wire pair to pin 5 of the DB9 connector or pin 7 of the DB25 connector.

4. Plug the DB9 connector or DB25 connector into the PC.

If the host is set up for hardware handshaking, use the following procedures:

1. Connect the yellow wire (RTS) from the yellow and red wire pair to pin 8 of the DB9 connector or pin 5 of the DB25 connector.
2. Connect the red wire (CTS) from the yellow and red wire pair to pin 7 of the DB9 connector or pin 4 of the DB25 connector.

**RS–422 Interface**

RS–422 interface signals are supplied by four wires from the Encompass 4 Reader communications cable. Your host must have an RS–422 interface with either an internal or external converter.

**Table 4-7** shows the RS–422 signals and their interface wires.

**Table 4-7 RS–422 Interface Signal Wiring for Colored-Wire Pair Cable**

<table>
<thead>
<tr>
<th>Signal from Encompass 4 Reader</th>
<th>Colored-Wire Pair Cable</th>
<th>Connect to Signal from Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS–422 Transmit positive</td>
<td>Yellow/Red</td>
<td>Yellow</td>
</tr>
<tr>
<td>RS–422 Transmit negative</td>
<td>Red</td>

</tr>
<tr>
<td>RS–422 Receive positive</td>
<td>Red/Black</td>
<td>Black</td>
</tr>
<tr>
<td>RS–422 Receive negative</td>
<td>Red</td>
<td>Transmit (–)</td>
</tr>
<tr>
<td>Signal Ground</td>
<td>Yellow/Black</td>
<td>Yellow or Black</td>
</tr>
</tbody>
</table>

**To connect the colored-wire cable using RS–422 interface**

1. Connect the yellow wire (transmit +) from the yellow and red wire pair to the host receive (+) signal.
2. Connect the red wire (transmit –) from the yellow and red wire pair to the host receive (–) signal.
3. Connect the black wire (receive +) from the red and black wire pair to the host transmit (+) signal.
4. Connect the red wire (receive –) from the red and black wire pair to the host transmit (–) signal.

**Wiegand Interface**

Wiegand interface signals are supplied by three wires from the Encompass 4 Reader communications cable. The Encompass 4 Reader with RS–232 or RS–422 comes with the Wiegand option built in. The Wiegand interface can only be used by the reader to output valid Wiegand tag reads. All reader commands and responses are issued through the serial interface.
Table 4-8 shows the Wiegand signals and the interface wires.

**Table 4-8  Wiegand Interface Signal Wiring for Colored-Wire Pair Cable**

<table>
<thead>
<tr>
<th>Signal from Encompass 4 Reader</th>
<th>Colored-Wire Pair Cable</th>
<th>Wire Pair from Encompass 4 Reader</th>
<th>Color Used</th>
<th>Connect to Signal from Host</th>

<td>Red</td>
<td>Red</td>
<td>Data1</td>
<td></td>
</tr>
<tr>
<td>Signal Ground</td>
<td>Yellow/Black</td>
<td>Yellow or black</td>
<td>Ground</td>
<td></td>
</tr>
</tbody>
</table>

To connect Wiegand interface

1. Connect the blue wire (data0) from the blue and red wire pair to the data0 wire of the Wiegand device.
2. Connect the red wire (data1) from the blue and red wire pair to the data1 wire of the Wiegand device.
3. Connect either the yellow or black wire from the yellow and black pair to the Wiegand device’s signal ground.

*Note:* The RS–232 or RS–422 interface is still included on the Encompass 4 Reader even when you use the Wiegand configuration. If serial communication is not needed, TransCore recommends leaving the DB9 or DB25 connected to the cable for future use.

**Warning**

*Do not cut the RS–232 red/black wires. If you cut the wires, you may not be able to use them in the future for testing, setting frequency, or adding additional functions.*

**Connecting Sense Input and Sense Output Circuits**

The Encompass 4 Reader has two sense input circuits and three sense output circuits available. The sense input circuits can be used to notify the Encompass 4 Reader of external events and are designed to be connected to a free-of-voltage dry contact. Sense output circuits are single-pole, double-throw relays that provide normally closed and normally open dry contacts. The relay contacts are rated at 42.2V AC peak (30 Vrms) or 60V DC at 1 A maximum. If controlling an external gate or device requiring high current, an isolation transformer is required.

The following sections provide information to connect the sense input and sense output circuits.
Sense Input Circuits

The Encompass 4 Reader supports two sense inputs – sense input0 and sense input1 – which requires two sense input lines for each loop sense or a total of four sense input connections. Sense input0 is the presence detection device line and is used to control RF power. As shown in Figure 4-16, sense input0 is through the red/green wire pair on the I/O pigtail. The Encompass 4 Reader expects the sense input0 circuit to close when a vehicle is present (i.e., a normally open condition). The minimum presence true period is fixed at 0 ms, which indicates that no delay occurs in closing the circuit when a vehicle is present.

Sense input1 allows the Encompass 4 Reader to monitor the status of a peripheral device. The host computer can then check the status by polling the Encompass 4 Reader.

![Figure 4-16 Sample Circuit Connections](image)

Sense Output Circuits

The Encompass 4 Reader supports three sets of sense output signals. Two sets – sense output0 and sense output1 – provide normally open or normally closed sense outputs. The third sense output set is dedicated for testing and set up of the reader. It is defined as the TAG_LOCK signal, which indicates a valid tag is in the read field.

These sense outputs are dry contacts that provide normally open and normally closed sense outputs. The relay contacts are rated at 42.2V AC peak (30 Vrms) or 60V DC at 1 A maximum. If controlling an external gate or device requiring high current, an isolation transformer is required.

As illustrated in Figure 4-16, sense output0, normally closed, is located on the orange/black pair. Sense output0, normally open, is located on the brown/black pair.
In Wiegand mode operation, the sense outputs are not controlled by a predefined output mode.

Table 4-9 lists the cable descriptions and functions for the interface signals. These wire pairs can be used or terminated based on the specific project applications and site requirements.

Using Table 4-9 as a guide to the functions of each of the wire signals, connect the remaining wires to the appropriate terminal blocks on the terminal strip in the junction box.

**Caution**

After connecting the wires in the communications cable, ground all drain wires from the communications cable to the chassis ground in the NEMA enclosure.

**Marking the Read Zone**

The area where the Encompass 4 reads tags at the current RF range is called the read zone. The antenna pattern, or read zone, of the Encompass 4 Reader would look roughly like a pear-shaped balloon if you were able to see it. When installing the Encompass 4 Reader, you should first mark the unit’s read zone using the RF range set at the factory-default maximum. You can later adjust the read zone using the techniques discussed in “Fine-Tuning and Verifying the Read Zone” on page 8-19.

If two Encompass 4 Readers are installed near each other, TransCore recommends that you fine-tune each reader for the ideal read zone before connecting it permanently to
sense input/sense output and communications cables. A minimum of 2 MHz frequency separation between the two adjacent readers is required for correct operation.

Required Materials
You need the following materials to mark the read zone:

- Test tags, supplied by the TransCore dealer or distributor
- Piece of windshield-type glass 0.190 to 0.230 inches (4.82 to 5.84 mm) in thickness and approximately 12 inches (30.48 cm) square on which to attach the eGo Plus Sticker Tag, eGo Plus Security Sticker Tag, or eGo WST

Caution
Both the eGo Plus Sticker Tag and eGo WST have a reduced read range when not attached to glass.

- Audible circuit tester and 9V DC battery for circuit tester power as described in the section “Bench Testing the Encompass 4 Reader Before Installation” on page 4-10.
- Piece of chalk or roll of tape
- Plastic or wooden yardstick for ATA or IAG tags
- Vinyl electrical tape or hook-and-loop material

Procedures
Note: Using test tags that are not mounted to vehicles give a general idea of the read pattern but the pattern will vary somewhat when actual vehicles with tags are tested. Final adjustments must be made with tags properly mounted on a variety of vehicles.

To mark the read zone
1. Confirm the following:
   - You have correctly connected the power supply as described “Connecting the AC Power Supply” on page 4-6 and “Connecting the DC Power Supply” on page 4-7.
   - You have correctly connected communications as described in “Connecting Communications” on page 4-23.
   - You have correctly connected sense input and sense output circuits as described in “Connecting Sense Input and Sense Output Circuits” on page 4-26.
2. Connect the red and white leads from the audible tester to the red and white pair of wires from the Encompass 4 Reader power/communications cable.
3. Start the terminal emulation application Microsoft HyperTerminal by selecting Programs>Accessories>Communications>HyperTerminal and press ENTER.
4. In the HyperTerminal dialog boxes choose the com port to which the communications interface is attached and set the properties as:

- Bits per second: 9600 baud
- Data bits: 8
- Parity: none
- Stop bits: 1
- Flow control: none

5. Cycle the power on the Encompass 4 Reader and ensure that the sign-on message displays.

6. Input the following commands in the order provided in Table 4-5 on page 4-11. Commands include those to switch to command mode, set operational mode, turn on RF, and return the reader to data mode.

7. Secure the ATA or IAG test tag to the end of the yardstick using electrical tape or hook-and-loop material or affix the test eGo Plus or eGo WST to the glass. Be sure the tag polarization (horizontal or vertical alignment) matches that of the Encompass 4 Reader or antenna used. If using an eGo Plus-type test tag or eGo WST, the glass should be in front of the tag (between the tag and the reader or antenna).

8. Stand directly in front of and about 5 feet (1.5 m) away (see Figure 4-17) from the Encompass 4 Reader or antenna. Hold the stick or the piece of glass so that the tag is positioned at a height and angle consistent with a tag installed on a vehicle. The test tag should cause the audible tester to sound.

   **Note:** *If you hold the test tag in your hand, your hand absorbs the RF signal and the test results are not accurate.*

9. Mark the spot with chalk or tape.

10. Move to the left until the sound stops and mark the ground with chalk or tape at the location of the tag when the sound stopped.

11. Return to the center and then move to the right until the sound stops and mark the ground with chalk or tape at the location of the tag when the sound stopped.

12. Return to the center and step backward 2 feet (0.6m) and repeat steps 5 through 7.

13. Continue moving the tag in this manner, placing marks on the ground to identify the boundary of the read zone each time the sound stops. Continue moving the tag to various locations until the read zone is fully marked.

14. You can now connect the outer marks to draw the outer boundary of the read zone.

   **Figure 4-17** is a view of a sample read zone within a controlled lane. The outer X marks show the outside edges of the read zone.
Figure 4-17 Sample Read Zone Marking Pattern

15. Standing at the farthest point of the pattern, walk toward the Encompass 4 Reader or antenna and listen for a continuous sound from the audible tester. If the sound is not continuous, it could indicate a weak or “patchy” RF pattern. See “Fine-Tuning and Verifying the Read Zone” on page 8-19 to adjust the read zone.
5

General Software Information
Chapter 5

General Software Information

This chapter provides software-related information for the Encompass® 4 Reader System.

This chapter presents various software-related topics arranged in alphabetical order by subject. In addition to this chapter, see Chapter 6, “Communications Protocols,” and Chapter 7, “Commands,” for more information.

Command Entry Conventions

All Encompass 4 Reader commands are preceded by the start-of-message character (#). The end-of-message sequence expected from the host is a carriage return (CR). The Encompass 4 Reader terminates messages with a return and a line-feed (CR/LF). For example, the command #01 Switch To Command Mode is typed as follows:

#01<ENTER>

where <ENTER> is the Enter or Return key.

Some command characters may be represented by the letter N. This letter indicates you are to supply a value. Maximum valid entries are the numbers 0 through 9 and the uppercase letters A through F. These letters allow for as many as 16 available user responses and are based on the hexadecimal numbering system.

Commands have at least two characters following the # character. Table 5-1 shows the basic structure of a four-character command.

Table 5-1  Four-Character Command Structure

<table>
<thead>
<tr>
<th>#</th>
<th>All commands are preceded by the # character.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Indicates the command group. This command is in Group 1-Communications Port Control.</td>
</tr>
<tr>
<td>0</td>
<td>Indicates the command subgroup. In this example, all commands with a second digit of 0 apply to the main port.</td>
</tr>
<tr>
<td>5</td>
<td>The command digit. In this example, the 0 indicates that this command affects the baud rate.</td>
</tr>
<tr>
<td>0</td>
<td>Indicates the setting. Normally this is a variable and is usually a hexadecimal value from 0 through F. In this example, 5 sets the baud rate to 9600, the factory setting. In some commands, this digit may be a four-place hexadecimal string or a character string.</td>
</tr>
</tbody>
</table>

Set Baud Rate To 9600 Baud

#1005
Command Response Conventions

Like the Encompass 4 Reader commands, responses are preceded by the # character. Many Encompass 4 Reader commands respond with #Done or #Error indicating the command was or was not recognized and completed. Other commands respond with a four-character identifier followed by one or more values.

Table 5-2 shows an example of a command/reply sequence. This example assumes that an Encompass 4 Reader with serial number SN97001P running version X.XX software is connected to a PC running a terminal emulation software package such as Windows Hyper Terminal or Procomm Plus. The command sequence verifies that communications are working correctly.

Table 5-2 Sample Command Sequence

<table>
<thead>
<tr>
<th>Entry</th>
<th>Encompass 4 Reader Response</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>#01 &lt;CR&gt;</td>
<td>#Done &lt;CR/LF&gt;</td>
<td>Switches Encompass 4 Reader to command mode.</td>
</tr>
<tr>
<td>#505 &lt;CR&gt;</td>
<td>#Model E4 Series Ver X.XX SN08001P &lt;CR/LF&gt;</td>
<td>Reports the software version and serial number.</td>
</tr>
<tr>
<td>#00 &lt;CR&gt;</td>
<td>#Done &lt;CR/LF&gt;</td>
<td>Returns Encompass 4 Reader to data mode.</td>
</tr>
</tbody>
</table>

In command discussions, Encompass 4 Reader response characters may be shown in brackets < >. The use of brackets indicates that the response is a value in the range of characters. The brackets are not part of the response. For example, the response to command #520 Display Power Fail Bit is either a 0 or a 1. In the command discussion, the response is shown as:

#PWRB <0-1>

with actual Encompass 4 Reader response being one of the following:

#PWRB 0

#PWRB 1

In this example, PWRB is the four-character identifier for power fail bit, and the 0 or 1 is the value. All spaces shown in the response are actual spaces sent from the Encompass 4 Reader. In this example, one space is between the letter B and the number.

Operating Parameters

The Encompass 4 Readers maintain their operating parameters in non-volatile memory (NVRAM) so that the parameters are preserved after a power-down sequence.
**Power Fail**

The system maintains a power fail flag. The host transmits command #520 Display Power Fail Bit to determine if a power down has occurred. This flag is cleared by both command #63 Reset Reader and command #65 Reset Power Fail Bit.

**Program Download**

Program download stores the Encompass 4 applications software into the reader’s flash memory. Program download is used to install program upgrades, add features, and to recover from corrupted program data.

*Note:* Program download is a hosted process. Exercise caution so that you don’t inadvertently enter download mode.

**Download Considerations**

You should consider the following factors when performing program download:

- The Encompass 4 Reader does not process tags while in download mode.
- The Encompass 4 Reader does not accept any program data unless a successful erase of flash memory has been performed before transmitting the data. Erasing the flash memory typically takes two seconds.
- Exiting from download mode re-executes startup. If the new software has been loaded without errors, the Encompass 4 Reader comes up in data mode. If a flash checksum error is detected, the Encompass 4 Reader reenters download mode and transmits a sign-on message with a boot version of 0.00x and without a serial number.

*Note:* The Encompass 4 Reader uses default communications parameters when operating in download mode – 38400 baud, 8 data bits, 1 stop bit, no parity, basic protocol – and does not echo commands.

**Download Procedures**

If TransCore releases a new version of the Encompass 4 Reader software or if the Encompass 4 Reader seems not to be working properly, you may need to download the software to the Encompass 4 Reader. Contact technical support or your TransCore Encompass 4 Reader sales representative.

**Startup**

Upon startup, Encompass 4 Reader’s transmit a sign-on message or a boot ROM failure message.
### Sign-On Message

If startup is successful, the sign-on message appears as follows:

*Model E4 Series [software version] SNYYYYY [Copyright notice]*

where *YYYYY* is the serial number assigned to the 4800 Reader unit being used.

Serial number 000000 is the default setting and is not a valid number. If this number appears in the sign-on message, the serial number has never been stored into reader memory. The serial number must be assigned by factory-authorized personnel using command #695S...S Set Serial Number. Because only six digits are allowed in the software, when setting the serial number skip the fourth (middle) digit of the seven-digit number shown on the reader label.

If the flash memory checksum does not indicate verification, the sign-on message appears as follows:

Model [E4] Ver 0.00x [Copyright notice]

### Boot Failure Message

The software performs a checksum function on itself. The function returns a specific value for the particular version of software. If the value returned is not correct, the boot ROM checksum assumes that locations have been corrupted and a failure condition exists. If the boot ROM checksum is not correct, a boot failure message is transmitted. If the failure message does not transmit, a communications error has occurred or the boot failed to the extent that it cannot transmit the failure message.

If the failure message version number equals 0.00 and no serial number exists, the flash memory checksum has failed, and the Encompass 4 Reader is operating out of boot ROM. In this case, the Encompass 4 Reader automatically enters download mode and waits for a new program to be loaded into the flash memory. Follow the instructions in “Program Download” on page 5-5 to download a new program.

### Tag/Message Buffer

In basic communication protocol, the Encompass 4 Reader does not provide tag memory storage beyond the quantity required for uniqueness checking. This feature allows adequate buffering of tag data under normal operating conditions. The Encompass 4 Reader cannot operate as a stand-alone component. When the buffer fills, subsequent tag IDs will be lost.

In error correcting protocol (ECP), a buffer of up to three additional tag reads will be held in case a host system is unable to acknowledge tag reads in real time.
Communications Protocols
This chapter describes the communications protocols for the Encompass® 4 Reader.

Introduction

The Encompass 4 Reader supports the following communications protocols:

- Basic
- Error correcting protocol (ECP)

The following protocol information provides reference information relevant to developing host software.

Communications are performed using the 7-bit ASCII code with optional parity, thus providing easy setup, testing, and diagnostics with standard ASCII terminals and serial printers. Parity must be enabled to achieve the specified undetected error rate.

Each message is framed within the start-of-message (som) and end-of-message (eom) characters so that the host computer can detect the beginning and end of each message. This convention is most important under marginal communications conditions during which the host may receive extraneous noise-induced characters between reader transmissions. In such instances, the host is capable of ignoring any messages that do not conform to the som...eom frame sequence.

Both data mode and command mode require a two-way message interchange is when using ECP. This interchange is completed by the message recipient returning a message acknowledgement to the message sender.

With ECP, all transmissions require a message. If a message is not received, the sender will time out with the same effect as if it had received a negative acknowledgment (from the host) or an Error message from the Encompass 4 Reader.

Software (XON/XOFF) flow control is optionally supported. Be careful in the use of XON/XOFF since noise-induced characters may be interpreted by the Encompass 4 Reader as the XOFF character, which would suspend reader output without information reaching the host computer. For more information see “Software Flow Control” on page 8-19.

Note: TransCore recommends that XON/XOFF flow control be disabled while using ECP.
Basic Protocol

With basic protocol, messages sent to and from the Encompass 4 Reader and the host are transmitted without error checking. For each host transmission, the Encompass 4 Reader returns a Done or Error message to the host.

When the host computer is physically close to the Encompass 4 Reader and no sources of interference exist, the basic protocol provides reliable communications.

The host must be ready to receive reader-transmitted messages because in basic protocol the Encompass 4 Reader does not wait for the host to acknowledge a message before transmitting the next message. If necessary, the host may halt reader transmissions by using software or hardware flow control. Refer to Chapter 8 for flow control information.

Error Correcting Protocol

When the quality of data communications is imperative or may be suspect, you can invoke ECP to ensure the integrity of data transmitted between the Encompass 4 Reader and the host.

Note: TransCore recommends that basic protocol (not ECP) be used when commands are entered manually at the keyboard.

Wiegand output is automatically disabled when the reader is put into ECP mode.

Error correction is accomplished with the use of a cyclic redundancy check (CRC) value that is based on the message data. The originator (reader or host) calculates the CRC value of a message and includes it in the transmitted message.

The recipient (reader or host) also calculates a CRC value for the received message. If the transmitted message data is correct, the CRC value calculated by the recipient will agree with the CRC value calculated by the originator. If the CRC values do not agree, the recipient rejects the message.

Message sequence numbers are also included when using ECP. These sequence numbers are checked to determine if the message received has the correct sequence number; if not, the recipient rejects the message.

Since the seven-bit ASCII code is used and there are eight data bits per character, the eighth bit can optionally be used to support parity. Where parity is selected, the CRC value calculation includes the parity of each character in the calculation of the CRC value.

Parity is required to achieve the most reliable communications. If parity is enabled, both the Encompass 4 Reader and the host must issue a message if any received character has a parity error. However, the message must not be transmitted before receipt of the eom character. In this case, the Encompass 4 Reader will issue an Error message, and the host computer will issue a negative acknowledgment message.
Basic Protocol and ECP Format

Note: In the following text, the symbols < and > are used to represent required variable message data, and the symbols [ ] are used to represent optional data. These symbols are not part of the message syntax.

Reader Transmissions

The basic protocol format and the data inquiry protocol format are as follows:

<som><data><eom>

The ECP format is as follows:

<som><seq><data><crc><eom>

where

<som> Start-of-message (ASCII # character)

<seq> Sequence number (ASCII hex) that represents an even number in the range 0–9, A–F (0, 2, 4, 6, 8, A, C, E). The Encompass 4 Reader maintains the number. The host must acknowledge reader transmissions by sending an ACK message with the same sequence number received from the Encompass 4 Reader. The Encompass 4 Reader updates its sequence number upon receipt of a valid host ACK. If an ACK is not received, the Encompass 4 Reader retransmits the message. A reader transmission sequence is not considered complete until the Encompass 4 Reader receives an ACK and updates its sequence number.

<data> An ASCII string up to 72 characters long. This string may contain tag data, a presence without tag report; an input status change report; an Error06, Error07, Error08, or Error11 message; or a sign-on message. Auxiliary data may also be included.

<crc> Field containing four ASCII digits that represent the 16-bit CRC value calculated on the message. The CRC value is calculated on bytes between the som character and the first <crc> byte.

When the host receives a properly framed message, it can calculate a 16-bit CRC value. The calculation is applied to the character string that immediately follows the <som> and that ends with the character immediately preceding the first <crc> character.

The transmitted CRC value can then be compared with the binary equivalent of the received <crc> characters. If the transmitted
and received CRC values do not match, the recipient assumes the message was received in error, and transmits a NAK message response.

<eom> End-of-message characters (ASCII CR and LF). The system includes both a carriage return (CR) and line feed (LF) to facilitate the use of terminals and printers.

If the host receives a <som> character in the middle of a data message, the message in progress is aborted. The assumption is that an <eom> was lost and the Encompass 4 Reader is in the process of retransmitting the previous message.

---

**ECP Host ACK/NAK Response**

With ECP, the host computer responds to all data message transmissions from the Encompass 4 Reader using the following acknowledgment or negative acknowledgment response format.

```
<som><seq><ack/nak><crc><eom>
```

where

- `<som>` Start-of-message (ASCII # character)
- `<seq>` An echo of the sequence number received from the Encompass 4 Reader. The sequence number should correspond to the data message that is being positively or negatively acknowledged by the host. If the Encompass 4 Reader receives an ACK message with the incorrect sequence number, the data message is retransmitted.

  The host computer resets the anticipated data message sequence number to that of the Encompass 4 Reader before communications can resume without error.

- `<ack/nak>` ASCII @ character for ACK response; ASCII ? character for NAK response
- `<crc>` CRC value for the message
- `<eom>` End-of-message character (ASCII CR)

The Encompass 4 Reader sets a user-programmable timeout delay at the time each message is transmitted based on command #612NN Set Error Correcting Protocol Timeout, where NN = timeout delay. To disable the timeout delay for diagnostic purposes, issue the command #612FF Disable Error Correcting Protocol Timeout.

If the timeout delay expires before the Encompass 4 Reader receives an ACK or NAK message from the host, a logical NAK condition will be declared. If the Encompass 4 Reader receives a NAK or timeout, the reader retransmits the data message.
When the Encompass 4 Reader receives an ACK message, the system software treats the message as having been properly received by the host. The software increments the sequence number, and advances pointers to the next message in the Encompass 4 Reader’s message queue to prepare for sending the next message.

---

**Switch to Command Mode Request**

The host computer may issue command #01 Switch to Command Mode while in data mode.

The basic protocol format is as follows:

```
<som><cmd><eom>
```

The ECP format is as follows:

```
<som><seq><cmd><crc><eom>
```

where

- `<som>` Start-of-message (ASCII # character)
- `<seq>` Sequence number generated by the host computer separately from that appearing in data messages transmitted by the Encompass 4 Reader
- `<cmd>` Switch to command mode (ASCII characters 01)
- `<crc>` CRC value for the message
- `<eom>` End-of-message character (ASCII CR)

---

**Host Transmission**

The host computer initiates synchronous communications between the Encompass 4 Reader and the host. The host begins a sequence by issuing a command; the Encompass 4 Reader responds accordingly.
The basic protocol format is as follows:

```
<som><cmd>[<data>]<eom>
```

The ECP format is as follows:

```
<som><seq><cmd>[<data>]<crc><eom>
```

where

- `<som>` Start-of-message (ASCII # character)
- `<seq>` Sequence number (ASCII hex digit) that represents an odd number in the range 0–9, A–F (1, 3, 5, 7, 9, B, D, F). The host should use odd sequence numbers in its command since the Encompass 4 Reader uses even sequence numbers in its transmissions. This method eliminates the possibility of a synchronous host command and an asynchronous reader transmission having the same sequence number.

Upon receiving a host command, the Encompass 4 Reader echoes the command’s sequence number in its response. Therefore, the host computer updates its sequence number upon receipt of a valid reader message. If the sequence number is not updated before transmission of the next command, the Encompass 4 Reader will not service the new command; it will retransmit its previous message. A command/message sequence is not complete until the host updates its sequence number.

- `<cmd>` Command code, a string that contains from two to four ASCII hex characters
- `[<data>]` Optional data field, an ASCII string of as many as 20 characters in length. For example, the store hardware configuration string command is `#696S...S` or command `#696 Store Hardware Configuration String` followed by the data string S...S.
- `<crc>` CRC value for the message
- `<eom>` End-of-message character (ASCII CR)

---

**Reader Command Response**

The basic protocol format is

```
<som><resp><eom>
```

The ECP format is

```
<som><seq><resp><crc><eom>
```
Communications Protocols

where

<som> Start-of-message (ASCII # character)
<seq> Echo of sequence number received in host command message
<resp> Response string. The Encompass 4 Reader returns Done, Error, or another ASCII string depending on the host transmission. This string can be up to 72 characters long.
<crc> CRC value for the message
<eom> End-of-message character (ASCII CR and LF)

Sample Messages
This section contains examples of typical messages transmitted between the Encompass 4 Reader and the host computer.

Reader Transmissions
Basic protocol reader transmission

#KING 1302<eom>

Host response

No host response for non-ECP

ECP reader transmission

#4KING 1302 <crc><eom>

where

# Start-of-message character
4 Message sequence number
KING 1302 Message data: Tag ID is shown.
Other sample message data could be as follows:
IOST C0 O2 I0 D24 (display I/O status)
Error06 (frequency not set)
<crc> CRC value for the message
<eom> End-of-message character

Host response

#4@<crc><eom>
where

#  Start-of-message character
4  Message sequence number
@  ACK (acknowledgment character)
    (? returned for a negative acknowledgment)
<cr> CRC value for the message
<eo> End-of-message character

**Host Command Transmissions**

Basic protocol host transmission

```
#647XXX<eo>
```

Reader response

```
#Done<eo> or #Error<eo>
```

#Error<eo> is returned if the host transmission is not a legal command with legal data.

ECP host transmission

```
#7647XXX<cr><eo>
```

where

#  Start-of-message character
7  Message sequence number
647XXX Select RF Operating Frequency command where 647XXX is the command and XXX is a hexadecimal value from 000 to 118. In this example, XXX sets the RF frequency to 903 MHz.
<cr> CRC value for the message
<eo> End-of-message character

Done Command has been invoked by the Encompass 4 Reader

Reader response

```
#7Done<cr><eo> or #7Error<eo>
```

For some commands, the Encompass 4 Reader responds with data that relates to the command, such as T0F 0, to indicate Wiegand mode enabled for a #532 Display Wiegand Mode Status command.
#7Error <eom> will be returned if host transmission is not a legal command with legal data.

---

**Timing and Synchronization**

The ECP is largely independent of baud rate. The timeout delays previously described are a function of baud rate.

The Encompass 4 Reader supports an ECP timeout, which applies equally to both transmit and receive.

The receiver’s minimum timeout delay equals the time to transmit/receive the longest anticipated message at the current baud rate setting. Additional margin should be included for idle periods between characters; for example, processing overhead, if any. The timeout delay period can be expressed as follows:

\[ T_{rec} (\text{ms}) = L \times [T_{char} + T_{idle}] \]

where

- \( T_{char} (\text{ms}) \) = \( 1000 \times \left[ \frac{B_c}{R_b} \right] \)
- \( B_c \) = Bits per character, typically 10
- \( R_b \) = Baud rate, 1200–38.4 K
- \( L \) = Length of message in characters
- \( T_{idle} \) = Maximum idle period between characters (ms)

*Note: The Encompass 4 Reader supports baud rates between 1200 and 38.4 K.*

Likewise, the sender must set a timeout delay equal to the delay of nine characters at the current baud rate setting. For example, the time required to shift out the <eom> character plus the time to shift in the ACK or NAK message to be received plus a processing allowance for the receiver to process the message and check for error conditions.

Thus, the sending timeout delay can be expressed as follows:

\[ T_{send} (\text{ms}) = 9 \times T_{char} + T_{errchk} \]

where

- \( T_{errchk} (\text{ms}) \) = Processing period to perform error checking by receiver

The host computer can remotely set the Encompass 4 Reader’s communications parameters while in the command mode, but TransCore does not recommend this action if communications conditions are marginal.

After the Encompass 4 Reader receives new communications parameters, the Encompass 4 Reader issues the Done message and switches to the new configuration imme-
The host computer switches its communications parameters immediately after the transaction is complete.

As noted, the message initiator, such as the Encompass 4 Reader in data mode and the host computer in command mode, starts a timeout counter at the time a message is transmitted. If the timeout expires before receiving an acknowledgement message, a logical NAK condition is declared, and the initiator assumes the message was received in error. In this instance, the message is retransmitted until an acknowledgement message is received.

The message recipient, such as the host computer in data mode and the Encompass 4 Reader in command mode, starts a timeout counter when a <som> character is received. If the timeout expires without the receipt of an <eom>, the message acquisition is aborted (reset), and the receiver waits for the next <som> character.

If the message recipient receives a second <som> character before an <eom> character, the message acquisition is aborted (reset), and retransmission of the previous message is assumed to be underway.

These strategies allow for recovery during periods when communications are marginal or completely lost.

**Note:** It is important that the host computer limit the period during which the Encompass 4 Reader remains in command mode to avoid losing tag IDs. RF is off in command mode and no tags can be read.

---

**Reader-Addressed Failure Conditions**

The Encompass 4 Reader addresses the following failure conditions.

**Illegal Sequence Number (not in the range 0–9, A–F)**

If the Encompass 4 Reader detects an illegal sequence number in a host command message, it discards the received message and sends no response. If it receives an illegal sequence number in an ACK message, it responds as if a NAK had been received and retransmits the data.

**Wrong Sequence Number**

If the Encompass 4 Reader receives the wrong sequence number in an ACK message, it responds as if a NAK had been received, and it retransmits the data.

**Incorrect CRC**

If the Encompass 4 Reader detects an incorrect CRC value in a host command message, it discards the received message. No response is sent. If it receives an incorrect CRC value in an ACK message, it responds as if a NAK had been received, and it retransmits the data.

**Illegal Command**

If the Encompass 4 Reader receives an illegal command, it returns its standard Error message.
**Transmission Timeout**
If the Encompass 4 Reader transmits an asynchronous message and the host does not send an ACK before the ECP timeout occurs, the Encompass 4 Reader retransmits the message.

**Receive Timeout**
If the Encompass 4 Reader receives a <som> but does not receive a matching <eom> before the ECP timeout occurs, it discards the incomplete message and resets its receiver.

**Asynchronous Message/Command Message Collision**
If the Encompass 4 Reader transmits asynchronous data at the same time that the host sends a command, the Encompass 4 Reader gives priority to receiving the command. It processes the command and sends a message before it retransmits the asynchronous data.

---

**Host-Addressed Failure Conditions**
The host computer addresses the following failure conditions.

**Illegal or Wrong Sequence Number**
If the host detects an illegal or wrong sequence number in a reader response, it retransmits the command with the same sequence number. If the host detects an illegal sequence number in an asynchronous reader transmission, it sends a NAK message.

**Incorrect CRC**
If the host detects an incorrect CRC value in a reader message, it retransmits the command with the same sequence number. If the host detects an incorrect CRC value in an asynchronous reader transmission, it transmits a NAK message.

**Transmission Timeout**
If the Encompass 4 Reader does not respond to a host command within a specified interval, the host software retransmits the command with the same sequence number.

**Receive Timeout**
If the host receives a <som> but does not receive a matching <eom> within a specified timeout interval, it discards the incomplete message and resets its receiver.

**Asynchronous Message/Command Message Collision**
If the host receives an asynchronous reader transmission at the same time it transmits a command, it ignores the asynchronous message and waits for the Encompass 4 Reader’s response. The Encompass 4 Reader retransmits asynchronous data after it transmits the command message.
ECP Reliability

An undetected error is defined as a message having incorrect data or status but no parity or CRC errors. An error transaction is defined as a message having either a parity or CRC error. Laboratory testing indicates an undetected error rate of less than one undetected error per 1,000,000 error transactions with parity enabled.

To ensure this error rate is not exceeded, the host must enable parity and adhere closely to the timing specifications discussed previously in this chapter in the “Timing and Synchronization” section.

CRC Calculation

The CRC used by the ECP is based on a 16-bit algorithm. The algorithm, as implemented, operates on eight-bit characters, for example, seven-bit ASCII character plus one optional parity bit. The 16-bit result is converted to four ASCII hex characters and is appended to messages transmitted by the Encompass 4 Reader.

The Encompass 4 Reader accepts four ASCII `<>` characters (60 hex) as a wild card CRC value in lieu of a valid four-character CRC value to facilitate testing and diagnostic checkout.

The Encompass 4 Reader implements the algorithm with a 512-byte lookup table to reduce the processing overhead requirements.

To simplify the implementation of the CRC algorithm by host software developers, several examples of the calculation are provided in C source code on the following pages. The calculation may be performed with or without a lookup table, depending on the trade-off between code memory and processing overhead.

Example 1 presents an example of a function (CALCCRC) that calculates the CRC value through a call to a separate function (UPDCRC).

```c
unsigned short calccrc(char *message)
{
    unsigned short crc = 0;
    for (; *message != (char)0;message++)
        crc = updcrc(*message & 0xff, crc);
    return (crc)
}
```
Example 2 shows an example of UPDCRC that does not require a lookup table.

```c
#define BITS_PER_CHAR   8
unsigned short updcrc (unsigned short ch, unsigned short crc)
{
    register short counter = BITS_PER_CHAR;
    register short temp    = crc;
    while (--counter >= 0)
    {
        if (temp & 0x8000)  {
            temp <<= 1;
            temp += (((ch <<= 1) & 0x0100) != 0);
            temp ^= 0x1021;
        } 
        else {
            temp <<= 1;
            temp += (((ch <<= 1) & 0x0100) != 0);
        }
    } 
    return(temp);
}
```

Example 3 contains an example of UPDCRC that does require a lookup table.

```c
#define updcrc(cp, crc)( crctab[((crc >> 8) & 255)]^ (crc << 8) ^ cp
static unsigned short crctab [256] = {
0x0000, 0x1021, 0x2042, 0x3063, 0x4048, 0x50a5, 0x60c6, 0x70e7, 0x8108, 0x9129, 0xa14a, 0xb16b, 0xc18c, 0xd1ad, 0xe1ce, 0xf1ef,
0x1231, 0x0210, 0x3273, 0x2252, 0x52b5, 0x4294, 0x72f7, 0x62d6, 0x9339, 0x8318, 0xb37b, 0xa35a, 0xd3bd, 0xc39c, 0xf3ff, 0xe3de,

}
Example 4 shows an example of a function that creates the lookup table.

```c
#include <stdio.h>
#define MAX_CHAR 256
#define BITS_CHAR 8
#define SIGN_BIT 0x8000
#define POLY 0x1021
unsigned short crctab[MAX_CHAR];
main()
{
  unsigned short ch;
  unsigned short workval;
  unsigned short bit;
  unsigned short carry;
  for (ch = 0; ch != MAX_CHAR; ch++) {
    workval = ch << BITS_CHAR;
    for (bit = BITS_CHAR; bit != 0; bit--) {
      carry = (workval & SIGN_BIT);
      workval <<= 1;
      if (carry)
        workval ^= POLY;
    }
    crctab[ch] = workval;
  }
  for (ch = 0; ch != MAX_CHAR; ch++)
    printf("0x%04x\n", crctab[ch]);
}
```

Manually Disabling ECP for Maintenance

Under certain conditions, communications between the host and Encompass 4 Reader may be lost temporarily and maintenance may be required. The reader or host is sending out a message and waiting for an acknowledgment. When the acknowledgment is not received, the message is sent again. Additional messages are also buffered. Often the first indication that the Encompass 4 Reader software is in an ECP “loop” is when the user/technician sees a recurring display of the same message repeated over and over again on the monitor. The procedure described in the following paragraphs enables the maintenance technician to change configuration or test tag reading manually.

Assuming that the ECP timeout is at the factory default of 12.7 seconds (or other value that allows enough time for the commands to be manually entered) the following command sequence may be used to break out of an ECP loop. This command sequence uses four ASCII `<` characters (60 hex) as wild card CRC values.

Note: The ASCII `<` character (60 hex) is commonly located on the ~ key.

You must acknowledge existing messages by issuing commands with the generic format:

```
#x@````<eom>
```

where

# Start-of-message character

x Message sequence number. This must be the same as the sequence number of the message being acknowledged

@ ACK (acknowledgment character)

```` Wild card CRC value for the message

<eom> End-of-message character

The following is a typical sequence after power-on limiting buffered messages.

Note: Ensure that no tags are in the field when you are performing this troubleshooting procedure.

Caution

To avoid damage to the Encompass 4 Reader that uses an external antenna, ensure that you have connected the antenna or a dummy load to the reader before applying power to the reader.

Reader transmission on power-up:

```
#0 Model .... SN <crc><eom>
```

Manually enter:

```
#0@````<eom>
```

Reader transmission  #2 Copyright 2008 TransCore <crc><eom>
Manually enter:  #2@````<eom>

Reader response:  #1Done< crc><eom>
Manually enter:  #3610````<eom>  this puts reader into basic protocol, disabling ECP
reader response:  Done
Enter any other desired diagnostic or directive commands in basic protocol. After maintenance is complete enter the command:

#00  to return the reader to data mode

or

#611  to return to error correcting protocol, and then either cycle power or issue #100````<eom> command to return reader to data mode
7

Commands
Chapter 7

Commands

This chapter discusses the host-transmitted commands that are used to control the Encompass® 4 Reader configuration and operation.

Introduction

The Encompass 4 Reader is delivered from the factory with specified default settings that determine how the reader operates. Commands transmitted by the host computer can change the default settings and control additional features. The commands can be transmitted by manually entering the commands at the host keyboard if the host is in terminal emulation mode. The Encompass 4 Reader can also communicate with ASCII terminals.

Note: If you are using Wiegand mode, you must connect the PC or laptop to the Encompass 4 Reader using the RS–232 or RS–422 interface and a terminal emulation program to send commands to the reader. You can leave the Wiegand interface connected during this procedure.

Operating Modes

The Encompass 4 Reader has three modes of operation: data mode, command mode, and download mode. The software for the Encompass 4 Reader contains two separate programs — boot and application. The boot program has control of the Encompass 4 Reader on startup and when operating in download mode. The application program has control of the Encompass 4 Reader during data mode and command mode operation and holds the application code. Together, they control the Encompass 4 Reader in the three modes of operation.

Data Mode

The Encompass 4 Reader is in the data mode upon power-up. While in the data mode, the Encompass 4 Reader sends all communications as data messages, such as tag IDs and reports, to the host computer. Reports provide information on input status changes (input0 and input1), a presence without tag report, and buffer overflow information.

The host computer can send only two commands to the Encompass 4 Reader while in data mode:

- Command #01 Switch To Command Mode changes the Encompass 4 Reader from the data mode to the command mode. See “01 Switch to Command Mode” on page 7-5.
Note: The Encompass 4 Reader transmits ID codes to the host computer when the Encompass 4 Reader is in data mode. If the Encompass 4 Reader remains in the command mode with tags passing through the read zone, all tag IDs are not reported.

Command Mode

While the Encompass 4 Reader is in the command mode, the host computer sends commands to the Encompass 4 Reader that can be used to control the operation and configuration of the reader. After the Encompass 4 Reader receives a command, it transmits a command response message. Typically, the command message contains Error, Done, or data relating specifically to the command request. These messages may be of variable length since some commands require information as part of the message; for example, Display Wiegand Mode Status.

Communications can be lost if the host computer attempts to send certain commands under marginal communications conditions. For example, if the host computer transmits the command request to change the baud rate and the Encompass 4 Reader properly receives the request and transmits the Done message, one of the two following conditions may occur:

• If the host computer receives the Done message, then both the host and the Encompass 4 Reader switch to the new baud rate, and communications are maintained.

Note: In many applications, the host must be set to the new baud rate as it will not change automatically.

Note: The Encompass 4 Reader changes the baud rate immediately after issuing the Done message.

• However, if the host does not receive the Done message transmitted by the Encompass 4 Reader, the host assumes that the command was not properly sent and does not switch to the new baud rate, causing a loss of communications.

Caution

The host computer should not attempt to change communications parameters or protocols during marginal communications conditions; otherwise, a loss of communications can result.

Download Mode

In download mode, the Encompass 4 Reader allows the host to download new software.

While in download mode, the reader communications port parameters are fixed at the following factory-default settings: 38400 baud, 8 data bits, 1 stop bit, no parity, software flow control (XON/XOFF), basic protocol.

While in download mode, the Encompass 4 Reader turns RF off, does not process tags, and does not echo host commands.
Command List

Reader commands are divided into groups based on primary function. The following sections provide information about each command in command number order. Refer to Appendix D for listings of commands in numerical and alphabetical order.

In the following text, the symbols `<` and `>` represent variable message data. These symbols are not part of the message syntax.

Hex digits (0–9, A–F) in either uppercase or lowercase characters may be used in data strings and for hex digits A–F.

Reader Mode Control — Command Group 0

Group 0 commands control reader mode. The mode determines whether the reader is transmitting data to or receiving data from a host computer or terminal.

00 Switch to Data Mode (Factory Default)

Command #00 switches the reader to data mode, which allows the reader to transmit tag data (ID codes) to the host. The reader enters data mode on power up.

While operating in data mode, the reader accepts the following commands:

- Command #01 Switch to Command Mode

Reader response:

Done

01 Switch to Command Mode

Command #01 switches the reader to command mode, which allows the reader to accept commands from a host or terminal. While in command mode, the reader turns RF off and does not acquire tags.

Reader response:

Done

06 Transmit Buffer Entry

Command #06 allows the host to request data (tag IDs and reports) from the reader. This command is supported if ECP is selected (command #611) and buffer control has been enabled (command #6161). If the reader receives command #06 and it has data in its message buffer, it transmits the buffered message of highest priority. Report data is not transmitted until all tag IDs have been transmitted.

If the reader’s message buffer is empty, it sends the Done message. The reader returns an Error message if it receives this command when ECP and/or the buffer control have not been enabled.
Communications Port Control — Command Group 1

Group 1 commands configure the parameters used by the Encompass 4 Reader to communicate with a host computer or terminal. These commands set baud rate, stop bits, parity, and end-of-line delay.

100N Select Baud Rate

Command #100N selects the reader baud rate. The factory-default setting is 9600 baud. The N variable specifies the baud rate shown in Table 7-1.

Table 7-1  Select Baud Rate Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Baud Rate Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>1002</td>
<td>1200</td>
</tr>
<tr>
<td>1003</td>
<td>2400</td>
</tr>
<tr>
<td>1004</td>
<td>4800</td>
</tr>
<tr>
<td>1005</td>
<td>9600 (factory default)</td>
</tr>
<tr>
<td>1006</td>
<td>19.2 K</td>
</tr>
<tr>
<td>1007</td>
<td>38.4 K</td>
</tr>
</tbody>
</table>

Caution
If ECP is enabled, ensure that the ECP timeout is sufficient for the new baud rate. See “Timing and Synchronization” on page 6-11.

Reader response:

Done

101N Select Stop Bits

Command #101N selects the number of stop bits for reader character transmission. The factory default setting is 1 stop bit. The N variable specifies the number of stop bits as indicated in Table 7-2.
**102N Select Parity**

Command #102N selects the reader parity setting. The factory-default setting is parity disabled. The variable specifies parity as shown in Table 7-3.

**Table 7-3 Select Parity Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Data Bits</th>
<th>Parity Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>1020</td>
<td>8</td>
<td>Disable parity (factory default)</td>
</tr>
<tr>
<td>1021</td>
<td>7</td>
<td>Select even parity</td>
</tr>
<tr>
<td>1022</td>
<td>7</td>
<td>Select odd parity</td>
</tr>
</tbody>
</table>

**Command Group 2**

Group 2 commands control the real-time clock which maintains the Encompass 4 internal time and date. This time and date can be appended to IDs, error messages, and sensor input reports. An internal battery supports the clock, so time and date are preserved if main power is lost.

**20 Set Time**

Command #20 sets the time. Enter the time in the proper format: two-digit decimal entries with no spaces between characters and using colons as delimiters. The entry format is as follows:

\[ 20HH:MM:SS \text{ or } 20HH:MM:SS:hh \]

where

- **HH** represents hours (00 to 23).
- **MM** represents minutes (00 to 59).
SS represents seconds (00 to 59).

hh represents hundredths of a second (00 to 99).

: is the time delimiter.

If hundredths of a second is not specified, the reader sets the hundredths register to 00.

Reader response:

Done

21 Set Date

Command #21 sets the date. Enter the date in the proper format: two-digit decimal entries with no spaces between characters and using forward slashes “/” as delimiters. The entry format is as follows:

21MM/DD/YY

where

MM represents the month (01 to 12).

DD represents the day (01 to 31).

YY represents the last two digits of the year (00 to 99).

/ is the date delimiter.

Reader response:

Done

22 Display Time and Date

Command #22 displays the reader’s current time and date. One space separates the time and the date output.

Reader message:

HH:MM:SS.hh MM/DD/YY

where

HH represents hours.

MM represents minutes.

SS represents seconds.

hh represents hundredths of seconds.

: is the time delimiter.

MM represents the month.

DD represents the day.

YY represents the last two digits of the year.

/ is the date delimiter.
Append Information — Command Group 3

Group 3 commands append useful information to reader transmissions, such as IDs, error messages, and sensor input reports. Auxiliary information such as reader number, antenna number (or manual entry code), number of times the previous tag was read, and sensor input status can be appended to the ID using the Group 3 commands.

30N Append Time and Date Selection

Command #30N selects the option of appending the time and date to transmitted IDs, error messages, presence without tag reports, and input status change reports. The factory default setting is time and date appended (command #302).

The reader returns an Error message if its tag buffer contains data. The reset reader command #63 may be transmitted to clear the buffer; however, tag ID data will not be reported. If this is unacceptable, allow the buffer to empty before re-issuing append time and date command #30N. Append Time and Date commands are shown in Table 7-4.

Table 7-4 Append Time and Date Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Append Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>300</td>
<td>No time and date appended</td>
</tr>
<tr>
<td>302</td>
<td>Time and date appended (factory default)</td>
</tr>
</tbody>
</table>

The reader transmits messages with time and date appended as follows. One space separates the time from the date.

\(<\text{string}>\&<\text{HH:MM:SS.hh MM/DD/YY}>\)

where

\(\text{string}\) is a tag ID, error message, or report.
\(\&\) separates \(\text{string}\) from the time and date.
\(\text{HH:MM:SS}\) is the time delimiter.
\(\text{MM/DD/YY}\) is the date delimiter.

Reader response:

\(\text{Done}\)

31N Append Auxiliary Information Selection

Command #31N selects the option of appending auxiliary information to transmitted IDs, presence-without-tag reports, and input status change reports. Auxiliary information is not appended to error messages. The factory-default setting is no auxiliary information appended. The N variable specifies whether or not auxiliary information is to be appended. Append Auxiliary Information commands are shown in Table 7-5.
The reader transmits messages with auxiliary information appended as:

\[ \text{<message data>\%<xx-y-zz-q>} \]

where

- **%** separates the auxiliary information and signals the host computer that auxiliary information is appended.
- **xx** reader ID. Value can be set with command \#60NN.
- **-** auxiliary information delimiter
- **y** antenna number. Value fixed at 0.
- **zz** number of reads (00 to FF hexadecimal) of the previous tag
- **q** current status of input0 and input1 (0 to 3). Refer to “526 Display I/O Status” on page 7-21. These values are inverted if input inversion is enabled with command 6941.

Reader response:

Done

### Table 7-5  Append Auxiliary Information Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Append Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>310</td>
<td>No auxiliary information appended (factory default)</td>
</tr>
<tr>
<td>311</td>
<td>Auxiliary information appended</td>
</tr>
</tbody>
</table>

ID Filtering — Command Group 4

Group 4 commands set criteria for filtering (buffering or discarding) ID codes. These commands are useful for eliminating duplicate ID codes and selecting the type of tags read by the Encompass 4 Reader.

**40 Transmit All ID Codes**

Command \#40 instructs the reader to transmit all IDs without regard for uniqueness. This command can be useful when tuning the lane and mapping the footprint or performing diagnostics.

After diagnostics are complete, you may want to reinstate the uniqueness check using command \#410N Select Unique ID Code Criteria.

Reader response:

Done
**410N Select Unique ID Code Criteria (Anti-passback Feature)**

Command #410N instructs the reader to buffer and transmit ID codes according to the following test: an ID is read if previously decoded IDs have changed value at least \( N+1 \) times since the new ID was last received. IDs that do not pass the test are not read. The factory-default setting is command #4100, which selects a separation of one ID. Variable \( N \) specifies ID separation as shown in Table 7-6.

### Table 7-6 Unique ID Code Criteria

<table>
<thead>
<tr>
<th>Command</th>
<th>Uniqueness Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>4100</td>
<td>Separation of 1 ID (factory default)</td>
</tr>
<tr>
<td>4101</td>
<td>Separation of 2 IDs</td>
</tr>
<tr>
<td>4102</td>
<td>Separation of 3 IDs</td>
</tr>
<tr>
<td>4103</td>
<td>Separation of 4 IDs</td>
</tr>
</tbody>
</table>

Each time the reader receives a tag ID, it compares the ID with the contents of a comparison register. This register contains the following two items:

- Item 1 Most recently acquired ID (different from Item 2)
- Item 2 Second-most recently acquired ID (different from Item 3)
- Item 3 Third-most recently acquired ID (different from Item 4)
- Item 4 Fourth-most recently acquired ID

When the uniqueness filter is set to separation of one ID, the newly acquired ID is transmitted only if it is different from the first item. Separation of two IDs allows transmission if the new ID is different from Items 1 and 2 in the comparison register. Separation of three and four IDs transmit the new ID only if it is different from the first three and the first four items, respectively.

**Note:** A new ID can fail the filter test and not be transmitted; however, it remains stored in the comparison register.

The uniqueness test has a two-minute time limit. If an ID is buffered, it will not be accepted again unless it arrives at the reader more than two minutes from the previous arrival or until the receipt of one or more other IDs reset the uniqueness.

Reader response:

**Done**

**420N Select Valid ID Code Criteria**

Command #420N directs the reader to validate an ID received only after it has been obtained a specified number of times in sequence. Values for \( N \) are 0 through 3 (Table 7-7). The factory setting is one acquisition (\( N = 0 \)).
The validation procedure is executed before the unique ID test (Select Unique ID Code Criteria \[\#410N\] commands). IDs that do not pass the validation test are not reported.

For example, command \#4203 specifies that the same ID must be obtained from the antenna/RF module 4 times in succession before it is considered for the uniqueness test. This feature is useful in installations where RF reflections may cause a single tag to be read multiple times or where an occasional ID might be read from fringe areas.

### 43 Buffer All ID Codes
Command \#43 buffers all acquired ID codes. It effectively cancels any uniqueness criteria previously set by select unique ID code criteria command 410N.

*Note: Command \#43 is for diagnostic purposes only.*

After diagnostics are complete, reset the select unique ID code criteria using command 410N.

Reader response:

*Done*

### 440 Reset Uniqueness
Command 440 causes the ID filtering process set by Select Unique ID Code Criteria \([\#410N]\) to restart. It is used in conjunction with the Variable Timeout \([\#44N]\) commands. This command provides a one-time reset at which point the previously set time-out interval resumes.

### 44N Set Uniqueness Timeout
Places a time limit on the uniqueness criterion set by Select Unique ID Code Criteria \([\#410N]\). The parameter \(N\) sets the number of minutes on the time-out clock. The factory setting is two minutes \((N = 1)\).

### Command Time-Out Clock

<table>
<thead>
<tr>
<th>Command</th>
<th>Time-Out Clock</th>
</tr>
</thead>
<tbody>
<tr>
<td>#441</td>
<td>2 minutes (factory setting)</td>
</tr>
<tr>
<td>#442</td>
<td>15 seconds</td>
</tr>
<tr>
<td>#443</td>
<td>30 seconds</td>
</tr>
</tbody>
</table>

Entering these commands effectively expires the time-out clock, which erases all current IDs in the comparison register. In effect, the first ID that is acquired after the clock expires always appears to be new and is stored. Newly acquired IDs are only tested against IDs that are registered after the clock resets.

The time-out clock is continually reset (does not expire) as long as the reader receives the same tag ID. For example, assume that the time-out clock is set for 2 minutes and there is a railcar parked on a siding in front of the reader. Without this reset feature, the railcar’s ID would be reported every 2 minutes (each time the time-out clock expired).

#### 450 Disable Wiegand Mode (Factory Default)

Command #450 is a default set in the factory to disable Wiegand mode.

Reader response:

```
Done
```

#### 451 Enable Wiegand Mode

Command #451 enables Wiegand mode, which allows the reader to transmit data in a format that emulates the output of a magnetic card reader.

In Wiegand mode, the reader transmits Wiegand-formatted tag data through the Wiegand interface and ASCII data (the reader accepts reader commands and responds) through the serial port interface. The reader outputs data from Wiegand-programmed tags via the Wiegand interface (the red/blue pair for data1/data0; yellow/black pair for logic ground). Tags that are not Wiegand-formatted are not transmitted through the Wiegand interface or the serial port when in Wiegand mode, although the tag lock relay is activated on any tag acquired.

Reader response:

```
Done
```

#### 452 Disable Tag Translation Mode (Factory Default)

Command #452 disables tag translation mode. Incoming full-frame tags will be directly converted to ASCII. They will not be translated from Association of American Railroads (AAR) and American Trucking Associations (ATA) format to ASCII.

Reader message:

```
Done
```
**453 Enable Tag Translation Mode**
Command #453 enables the translation of tags in AAR and ATA formats. Specific data fields, such as owner ID and car number, will be extracted from these tags, translated according to AAR or ATA standards, and converted to ASCII. Tags that are not programmed in AAR or ATA format will be directly converted to ASCII. The reader will not attempt to translate data from half-frame or dual-frame tags.

Reader message:

*Done*

**454 Disable Multi-tag Sort (Factory Default)**
Command #454 is a default set in the factory to disable the multi-tag sort function.

Reader response:

*Done*

**455 Enable Multi-tag Sort**
Command #455 enables the multi-tag sort function that allows the reader to identify unique tags within a group of Intellitag-based tags. Multi-tag sort allows full operation of the tags and reader to be carried out with any number of tags in the presence of the reader.

Reader response:

*Done*

*Note:* Enabling the multi-tag sort function adversely affects the vehicle speed at which tags may be read. If there is only one Intellitag-based tag in the vehicles of the target population, multi-tag sort should be disabled.

**456 Enable eGo Plus Tag Initialization During Multi-tag Sort (Factory Default)**
Command #456 enables the reader to send the eGo Plus Tag initialize command as part of the multi-tag sort function. When the reader sends the eGo Plus Tag initialize command, all tags in the RF field reenter the sort process.

Reader response:

*Done*

**457 Disable eGo Plus Tag Initialization During Multi-tag Sort**
Command #457 disables the reader from sending the eGo Plus Tag initialize command as part of the multi-tag sort function. Any eGo Plus Tags already identified by the reader during the sort process will not be re-identified as long as they remain powered in the RF field. The reader will only identify new tags that come into the RF field or tags that do not remain powered in the RF field.

Reader response:

*Done*
458 Disable Second Alternate Group Select (Factory Default)
Command #458 is a default set in the factory to disable the second alternate group select function.

Reader response:
Done

459 Enable Second Alternate Group Select
Command #459 enables the second alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Caution
When second alternate group select is enabled, tags not programmed to meet the specified criteria will not be read.

Reader response:
Done

46NN Set Wiegand Retransmit Interval
Command #46NN sets the time delay to control the reader retransmission of Wiegand data of a tag remaining in the read zone where NN is a hexadecimal code from 01 to FF.

Note: The actual value of the Wiegand retransmit interval may vary depending on the operative tag read mode and the type of tag in the read field.

For example, 10 = 16 seconds and FF = 255 seconds. The factory default is 4601 (1 second).

Uppercase or lowercase characters are allowed for NN; for example, hex digits A through F or a through f.

Reader response:
Done

480 Disable ATA
Command #480 disables the reader from reading ATA protocol tags.

481 Enable ATA
Command #481 enables the reader to read ATA protocol data from tags if the reader is programmed to read this tag protocol.

482 Disable eGo
Command #482 disables the reader from reading protocol eGo data from tags.

483 Enable eGo
Command #483 enables the reader to read factory-programmed eGo data from tags if the reader is programmed to read this tag protocol.
484 Disable SeGo
Command #484 disables the reader from reading SeGo protocol data from tags.

485 Enable SeGo
Command #485 enables the reader to read SeGo protocol data from tags if the reader is programmed to read this tag protocol.

486 Disable IAG
Command #486 disables the reader from reading IAG protocol data from tags.

487 Enable IAG
Command #487 enables the reader to read IAG protocol data from tags if the reader is programmed to read this tag protocol.

488 Disable eATA
Command #488 disables the reader from reading factory-programmed eATA data from tags.

489 Enable eATA
Command #489 enables the reader to read factory-programmed eATA data from eGo Plus or eGo tags. This option must be enabled to obtain Wiegand data from eGo Plus or eGo tags.

490 Disable Third Alternate Group Select (Factory Default)
Command #490 is a default set in the factory to disable the third alternate group select function.

Reader response:
Done

491 Enable Third Alternate Group Select
Command #491 enables the third alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Caution
When third alternate group select is enabled, tags not programmed to meet the specified criteria will not be read.

Reader response:
Done

492 Disable Fourth Alternate Group Select (Factory Default)
Command #492 is a default set in the factory to disable the fourth alternate group select function.

Reader response:
Done
493 Enable Fourth Alternate Group Select
Command #493 enables the fourth alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Caution
When fourth alternate group select is enabled, tags not programmed to meet the specified criteria will not be read.

Reader response:
Done

494 Disable Fifth Alternate Group Select (Factory Default)
Command #494 is a default set in the factory to disable the fifth alternate group select function.

Reader response:
Done

495 Enable Fifth Alternate Group Select
Command #495 enables the fifth alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Caution
When fifth alternate group select is enabled, tags not programmed to meet the specified criteria will not be read.

Reader response:
Done

496 Disable Alternate Group Select (Factory Default)
Command #496 disables the alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Reader response:
Done

497 Enable Alternate Group Select
Command #497 enables the alternate group select function that allows the reader to distinguish tags meeting specific criteria pre-programmed into the tags.

Reader response:
Done
Reader Status — Command Group 5

Group 5 commands provide status reports on the parameters and operation of the reader.

505 Display Software Version

Command #505 displays the reader model number, software version information, and assigned serial number.

Reader message:

Model E4 Series Ver X.XX SNYYYYYY

where

X.XX Version number

YYYYYY Serial number of the unit, skipping the fourth character printed on the reader product label

506 Display Hardware Configuration Information

Command #506 displays hardware configuration information stored in the reader memory by the user. Hardware configuration information is empty by default until you set the information to any 20 character ASCII string desired using command #696S...S.

Reader response:

An ASCII string from 1 to 20 characters in length

510 Display RF Transceiver FPGA Version

Command #510 displays RF FPGA VER = XX.XX

511 Display RF Transceiver I Filter Chip Version

Command #511 displays FIL IC I VER = XX.XX

512 Display RF Transceiver Q Filter Chip Version

Command #512 displays FIL IC Q VER = XX.XX

513 Display DSP Board Actel Version

Command #513 displays DSP FPGA VER = XX.XX

520 Display Power Fail Bit

Command #520 displays the value of the reader power fail bit. The power fail bit changes from 0 to 1 when power to the reader is interrupted. To reset the bit, use command #63 Reset Reader or command #65 Reset Power Fail Bit. On initial power-up, the host should transmit one of these two commands to clear the power fail bit.

Reader message:

PWRB P<0 to 1> R0
where

P0  No power failure detected
P1  Power failure detected
R0  Not applicable to Encompass 4 Reader

521 Display Reader ID Number
Command #521 displays the reader ID that is sent in the auxiliary data field.
Reader message:

   RDID xx
where xx = 01 to FF (hexadecimal)

522 Display Communications Port Parameters
Command #522 displays the selected communications port parameters, including the baud rate (#100N), the number of stop bits (#101N), the parity scheme (#102N), and the end-of-line delay.
Reader message:

   MAIN B<2 to 7> S<0 to 1> P<0 to 2> D0
where

B2  1200 baud
B3  2400 baud
B4  4800 baud
B5  9600 baud (factory default)
B6  19.2 kbps
B7  38.4 kbps
S0  one stop bit (factory default)
S1  two stop bits
P0  no parity (factory default)
P1  even parity
P2  odd parity
D0  00 ms end-of-line delay (fixed)
One space is required between each value. For example, if factory default settings are assigned, the reader message is

```
MAIN B5 S0 P0 D0
```
indicating 9600 baud, one stop bit, no parity, and 0 ms end-of-line delay.

**Note:** The information transmitted in response to command #522 applies to data and command mode operation only. While operating in download mode, default communications parameters are always used.

### 524 Display Appended Information Status

Command #524 displays the information being appended to the reader transmissions. Command #31N appends information. Append time and date are not available to the Encompass 4 Reader.

Reader message:

```
IDAP T<0> D<0> X<0 to 1>
```

where

- **T0** Time not appended
- **T1** Time appended (not valid for the Encompass 4 Reader)
- **D0** Date not appended
- **D1** Date appended (not valid for the Encompass 4 Reader)
- **X0** Auxiliary information not appended (factory default)
- **X1** Auxiliary information appended

One space is required between each value. For example, if factory-default settings are assigned, the reader response is

```
IDAP T0 D0 X0
```
indicating time, date, and auxiliary information not appended.

**Note:** Time and date may be appended to ID codes, error messages, presence without tag reports, and input status change reports. Auxiliary information may only be appended to ID codes, presence without tag reports, and input change reports.

### 525 Display Communications Protocol Status

Command #525 displays the status of command #61N Selected Communications Protocol, command #614N Selected Mode of Flow Control, and command #612NN ECP Timeout.

Reader response:

```
ECPS P<0 to 1> T<01 to FF> X<0 to 2> S0
```
Commands

where

P0  Basic protocol enabled (factory default)
P1  ECP enabled
Txx ECP timeout where xx = 01 to FE (hexadecimal)
    Timeout (ms) = 50 * xx
    If xx = FF timeout disabled
X0  Flow control disabled
X1  Software flow control enabled (factory default)
X2  Hardware flow control enabled
S0  start of message character is #

For example, if factory default settings are assigned, the reader message is:

ECPS P0 TFE X1 S0

which means basic protocol enabled, an ECP timeout of 254 (12,700 ms, 12.7 sec),
software flow control enabled, and start of message character is #.

526 Display I/O Status

Command #526 displays the current input/output (I/O) status. The reader message
indicates whether outputs are being controlled externally by the host through com-
mand #620N Output Control or internally through command #621 Predefined Output
Mode. It also displays the current status of two outputs, two inputs, and the selected
output pulse duration that is set by command #67N.

Reader response:

IOST C<0 to 1> O<0 to 3> I<0 to 3> D<0 to F>

where

C0  Host controls outputs
C1  Predefined output mode
O0  Both outputs off
O1  Output0 on
O2  Output1 on
O3  Both outputs on
I0  Both inputs false
I1  Input0 true
I2  Input1 true
I3  Both inputs true
D0  4 ms output pulse duration
D1  8 ms output pulse duration
D2  12 ms output pulse duration
D3  16 ms output pulse duration
D4  20 ms output pulse duration
D5  24 ms output pulse duration
D6  32 ms output pulse duration
D7  40 ms output pulse duration
D8  48 ms output pulse duration
D9  60 ms output pulse duration
DA  76 ms output pulse duration
DB  152 ms output pulse duration
DC  228 ms output pulse duration (factory default)
DD  300 ms output pulse duration
DE  376 ms output pulse duration
DF  752 ms output pulse duration

Note: The first character of the output pulse duration value is alpha; the second character is numeric.

Table 7-8 shows the output0 and output1 open/closed conditions for the output status displays.

Table 7-8 Open/Closed Conditions for Output Status

527 Display RF Status

Command #527 displays the current status of the RF module. The reader response indicates whether RF is controlled externally by the host, set by command #640 RF Control, or internally by input set by command #641. Command #527 also displays the current RF status and the uniqueness timeout.

Note: If you enter RF settings using command #642NN, the display command for RF output frequency, F is "Fxx" and indicates use of the backward-compatible frequency entry method.

Reader message:

    RFST C<0 to 1> O<0 to 1> T<1 to 3> Fxxx Rxx Gxx Axx Ixx

where

C0  RF controlled by host
C1  RF controlled by presence sensor on input0, the red/green pair (factory default)
O0  RF off
O1  RF on
T1  Uniqueness timeout of two minutes
T2  Uniqueness timeout of 15 seconds
T3  Uniqueness timeout of 30 seconds
Fxxx RF output frequency, xxx = 000 to 118 hexadecimal offset in 250 kHz from 860 MHz. If an invalid frequency value is stored (corrupted NVRAM), then xxx = “XXX” to indicate an error in the frequency setting.
**Rxx** Tag decoder range (distance) for ATA tags, xx = 00 to 1F hexadecimal range value

**Gxx** Tag decoder range (distance) for eGo and eGo Plus tags, xx = 00 to 1F hexadecimal range value

**Axx** RF power attenuation, where 00 is maximum output power and 0A is minimum output power (10dB less than maximum power).

**Ixx** IAG RF power attenuation, where 00 is maximum output power and 0F is minimum output power (15 dB less than maximum power)

For example, if factory default settings are assigned, the reader message is

```
RFST C1 O0 T1 Fxx R1F G1F A00 I04
```

which means that RF is enabled by presence sensor on input0, RF signal off, uniqueness timeout of two minutes, RF output frequency has not been set, maximum RF output range for ATA tags, maximum RF output range for eGo and eGo Plus tags, full RF power, and IAG power set at 4 dB attenuation.

**529 Display Presence Input Status**

Command #529 displays the parameters associated with presence detection and RF control. The reader’s message indicates if presence without tag reports are enabled/disabled (#690N Select Presence without Tag Report Option), if input inversion is enabled/disabled (#694N Select Input Inversion Option), and the minimum presence true period (always true). The reader’s message also reports the selected RF timeout (#693N Select RF Timeout Period) and the selected means of RF-off control (#692N Select RF Control Algorithm). If presence without tag reports is enabled (#6901 Enable Presence without Tag Reports), the reader transmits a report if a presence is detected without the subsequent acquisition of a valid tag.

**Note:** RF timeout values vary depending on the operative tag read mode and the type of tag in the read field. All times are approximate.

Reader message:

```
PRST P<0 to 1> D0 A<0 to 2> T<0 to F> I<0 to 1>
```

where

**P0** Presence without tag reports disabled (factory default)

**P1** Presence without tag reports enabled

**D0** Minimum presence true period of 0 ms (fixed)

**A0** RF off on timeout only

**A1** RF off on timeout or tag
Commands

A2  RF off on timeout or presence condition false (factory default)
T0  RF timeout of 0 ms (always expired)
T1  4 ms
T2  8 ms
T3  12 ms
T4  20 ms
T5  24 ms
T6  32 ms
T7  48 ms
T8  60 ms
T9  92 ms
TA  152 ms
TB  300 ms
TC  452 ms
TD  600 ms
TE  752 ms
TF  RF timeout infinite, never expires (factory default)
I0  input inversion disabled (factory default)
I1  input inversion enabled

For example, if factory default settings are assigned, the reader message is

```
PRST P0 D0 A2 TF I0
```

which means that presence without tag reports is disabled, minimum presence true period is 0, RF off control on timeout or presence false, infinite RF timeout, and input inversion disabled.

530 Display RF0 Filter Status

Command #530 displays the parameter set for the RF input, including the selected unique ID code criteria (#410N Select Unique ID Code Criteria) and the valid ID code criteria, which are fixed at one acquisition.
Reader message:

$$RF0S \quad U<0 \quad to \quad 2> \quad V0$$

where

- **U0**: One ID separation (factory default)
- **U1**: Two ID separations
- **U2**: Transmit all IDs
- **V0**: Valid ID code criteria of one acquisition (fixed)

For example, if factory default settings are assigned, the reader message is

$$RF0S \quad U0 \quad V0$$

which means separation of one ID for uniqueness filtering and a valid ID code criteria of one acquisition.

### 532 Display Wiegand Mode Status

Command #532 displays the Wiegand mode status as either enabled or disabled.

Reader message:

$$TOF <0 \quad to \quad 1>$$

where

- **0**: Wiegand mode disabled
- **1**: Wiegand mode enabled

### 533 Display Wiegand Retransmit Interval

Command #533 displays the Wiegand retransmit interval. This interval specifies the delay in seconds before the reader retransmits Wiegand data for a tag still in the read zone. The factory default is 1 second.

Reader message:

$$WTI <01 \quad to \quad FF>$$

where **01 to FF** = seconds (1–255) in hexadecimal.

**Note:** The actual value of the Wiegand retransmit interval may vary depending on the operative tag read mode and the type of tag in the read field.

For example, **10 = 16** seconds and **FF = 255** seconds. The retransmit interval in ATA tag read mode is about twice these values.

### 534 Display Tag Translation Mode Status

Command #534 displays tag translation mode status, enabled or disabled. If tag translation mode is enabled, incoming full-frame tags in AAR or ATA format are
translated according to ISO standards. Refer to “452 Disable Tag Translation Mode (Factory Default)” on page 7-13 and “453 Enable Tag Translation Mode” on page 7-14 for more information.

Reader message:

\[ TT <0 \text{ to } 1> \]

where

0 tag translation mode disabled
1 tag translation mode enabled

**535 Display Buffer Control Status**

Command \#535 displays buffer control mode status, enabled or disabled. Refer to “6160 Disable Buffer Control Mode (Factory Default)” on page 7-31 and “6161 Enable Buffer Control Mode” on page 7-32 for more information.

Reader message:

\[ BCM <0 \text{ to } 1> \]

where

0 buffer control mode disabled
1 buffer control mode enabled

**536 Display Dual-Frame Processing Mode**

Command \#536 displays the selected dual-frame processing mode. The mode used determines if frame A or frame B of a dual-frame tag resets uniqueness and which frame(s) are transmitted to the host, A, B, or both.

Reader message:

\[ DUAL <0 \text{ to } 3> \]

where

0 reset uniqueness on A, transmit A
1 reset uniqueness on B, transmit B
2 reset uniqueness on A, transmit both A and B
3 reset uniqueness on B, transmit both A and B

**537 Display Echo Status**

Command \#537 displays echo mode status. In basic protocol (#610 Select Basic Protocol), the reader may be configured to enable (#6171 Enable Echo Mode) or disable (#6170 Disable Echo Mode) the echo of received commands. Refer to sections 6170 Disable Echo Mode and “6171 Enable Echo Mode (Factory Default)” on page 7-33 for more information.

Reader message:

\[ ECHO <0 \text{ to } 1> \]
where

0   Echo status disabled (factory default)
1   Echo status enabled

**540 Display Flash Checksum**
Command #540 displays the flash memory checksum.
Reader message:

\[\text{PCKS } 0000 \text{ Exxx}x\]

where

0000 Not applicable to the Encompass 4 Reader
xxxx Represents the four-byte ASCII representation of the flash memory checksum

**543 Display Boot Checksum**
Command #543 displays the boot ROM checksum.
Reader message:

\[\text{BCKS } \text{xxxx}\]

where xxxx represents the four-byte ASCII representation of the boot ROM checksum.

**550 Display Periodic Check Tag Status**
Command #550 displays parameters for the periodic check tag function.
Reader message:

\[\text{SCTS M0 (fixed)}\]

**551 Display Selected Check Tag Option**
Command #551 displays the currently selected check tag option.
Reader message:

\[\text{CTAG 0 (fixed)}\]

**560 Request Sensor Status Change**
Command #560 displays the sensor status change reporting. Status change reporting may be disabled by command #82N Select Input Status Change Report Option.
Reader message:

\[\text{SSTC } \text{E<0 to 1>M<0 to 3>}\]

where

E0 Input status change reports disabled (factory default)
E1  Input status change reports enabled  
M0  Reporting disabled (factory default)  
M1  Changes on input0 reported  
M2  Changes on input1 reported  
M3  Changes on either input reported

For example, if factory default settings are assigned, the reader message is

    SSTC E0 M0

which means that input status change reports are disabled on both input0 and input1.

**570 Display Operating Mode Status**

Command #570 displays the currently selected tag read mode.

Reader response:

    ATA:<E, D> eGo:<I, F, D> SeGo:<I, F, D> IAG:<E, D> Sort:<E, D>

where

I  ID (64 bits)
E  Enabled
F  Full transaction (eATA)
D  Disabled

**577 Report Buffered Handshakes**

Command #577 reports the buffered handshakes.

Reader message:

    XX

where

XX is number of handshakes

---

**Reader Control Functions — Command Group 6**

Group 6 commands set reader control functions such as reader ID, communication protocol, output pulse, and RF control.

**60NN Set Reader ID Number**

Command #60NN sets the reader ID that will be sent in the auxiliary data field (command #311). Uppercase or lowercase characters are allowed for NN; for example, hex digits A though F or a through f
where $NN = 00$ to $FF$ (hex for 0 to 255, factory default = 00).

Reader response:

Done

610 Select Basic Communication Protocol (Factory Default)
Command #610 enables the basic communications protocol. Refer to “Basic Protocol” on page 6-4 for more information.

Reader response:

Done

611 Select Error Correcting Protocol
Command #611 enables the error correcting protocol. Refer to “Error Correcting Protocol” on page 6-4 for more information.

Reader response:

Done

Caution
Do not switch to ECP (command #611 Select Error Correcting Protocol) unless the host is prepared to acknowledge each reader transmission.

612NN Select Error Correcting Protocol Timeout
Command #612NN selects the timeout interval for ECP. This timeout applies to the transmission of tag, report, and error messages and to the receipt of host commands. The transmit timeout is initiated immediately after the end-of-message sequence CR/LF is transmitted. If the host does not acknowledge the message within the specified interval, the reader times out and retransmits the message.

The receive timeout is initiated upon receipt of the start-of-message character (#). If the end-of-message character (CR) is not received within the specified interval, the reader discards the partially received message and resets its receiver.

Uppercase or lowercase characters are allowed for NN; for example, hex digits A through F or a through f.

The value for NN specifies the timeout interval as follows:

- **ms**: $50 \times NN$ for $NN = 01$ to $FE$ (1–254)
- **FE**: Factory default (12,700 ms, 12.7 seconds)
- **FF**: Disables the ECP timeout

Reader response:

Done

Caution
Ensure that the ECP timeout is sufficient for a given baud rate. See “Timing and Synchronization” on page 6-11.
613 Enable Data Inquiry Protocol
Command #613 enable the data inquiry protocol.

Reader response:
  Done

614N Select Flow Control Option
Command #614N selects the flow control option for reader-to-host communications. The factory default setting is software flow control (XON/XOFF) enabled. In download mode, flow control is not host-selectable; it is fixed at the default setting. However, during data mode and command mode operation, the following flow control options are available. The N variable specifies flow control as shown in Table 7-10.

Table 7-10 Flow Control Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Flow Control Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>6140</td>
<td>Disable flow control</td>
</tr>
<tr>
<td>6141</td>
<td>Enable software flow control (factory default)</td>
</tr>
<tr>
<td>6142</td>
<td>Enable hardware flow control</td>
</tr>
</tbody>
</table>

Reader response:
  Done

If the reader is configured for software flow control (XON/XOFF), it stops transmitting if it receives an XOFF character (host software command 13H). It does not resume transmitting until it receives an XON character (host software command 11H). If the reader is configured for hardware flow control (RTS/CTS, request to send/clear to send), it stops transmission if it detects that the CTS line is no longer asserted. It resumes transmission when this line is asserted again.

Note: TransCore recommends that XON/XOFF flow control be disabled while using the ECP.

6160 Disable Buffer Control Mode (Factory Default)
Command #6160 is used to disable buffer control. Buffer control is an ECP option that prevents unsolicited (asynchronous) reader transmissions. If buffer control is not active, the reader transmits data to the host as soon as the data is acquired. The host must acknowledge the data according to the ECP acknowledgment/negative acknowledgment (ACK/NAK) protocol. Refer to command #6161 for more information.

Reader response:
  Done
6161 Enable Buffer Control Mode

Command #6161 is used to enable buffer control. Buffer control is an ECP option that prevents asynchronous reader transmissions. When buffer control is enabled using command #6161, the reader transmits only in response to command #06, transmit buffer entry. The exception to this rule occurs on startup when the reader transmits its two-line sign-on message asynchronously.

The following commands are used for buffer control:

<table>
<thead>
<tr>
<th>Number</th>
<th>Command Description</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>06</td>
<td>Transmit buffer entry</td>
<td>Done, error, or &lt;message&gt;</td>
</tr>
<tr>
<td>535</td>
<td>Display buffer control status where x= 0 for disabled</td>
<td>BCM x</td>
</tr>
<tr>
<td></td>
<td>1 for enabled</td>
<td></td>
</tr>
<tr>
<td>6160</td>
<td>Disable buffer control mode (default)</td>
<td>Done</td>
</tr>
<tr>
<td>6161</td>
<td>Enable buffer control mode</td>
<td>Done</td>
</tr>
</tbody>
</table>

If BCM is enabled, the host must request tag IDs and reports from the reader using the transmit buffer entry command 06. If the reader receives this command and it has data in its buffer, it will transmit the buffered message of highest priority (tag IDs first and then reports). If the reader’s buffer is empty, it will transmit the Done message instead. The reader will return an Error message if it receives command #06 when BCM is not enabled.

If buffer control is enabled, the reader will not support ECP ACK or NAK messages from the host. Since all messages are transmitted in response to a host command, acknowledgment from the host is not required. Instead, the ECP sequence numbers are used to ensure data integrity. If the host receives an erroneous reader message, it should retransmit command #06, transmit buffer entry, with the same sequence number. This will cause the reader to search and replace its previous message.

If buffer control is enabled, the reader will not use the timeout to trigger retransmission of data because in buffer control, reader data is transmitted only when requested by the host.

Reader response:

Done

Buffer Control Error Messages

The error messages shown in the following table are transmitted based on the content level of the tag buffer. These messages are transmitted in data mode and command mode. They will not be transmitted if uniqueness checking has been disabled to transmit all IDs (command #40) or buffer all IDs (command #43).
If the buffer fills up and then transmission is re-enabled, the sequence of transmitted reports would be as follows:

- **Error 04**: 75% full
- **Error 02**: 100% full
- **Error 03**: emptied to less than 100%
- **Error 05**: emptied to 50% or less

### 6170 Disable Echo Mode

Command #6170 disables the reader’s echo of received host commands. If operating in basic protocol or data inquiry protocol, the reader echoes by default. As the reader receives a host command, it echoes each character of the command. Once the entire command has been received and processed, the reader transmits its response. If echoing is disabled with command #6170, the reader does not echo the command, but only transmits its response. The reader never echoes while in ECP or download mode operation.

Reader response:

```
Done
```

### 6171 Enable Echo Mode (Factory Default)

Command #6171 enables the reader to echo received host commands. Command #6170 disables echo mode.

Reader response:

```
Done
```

### 620N Set Output Control

Command #620N provides direct control of two output lines that may be used to operate external hardware, such as gates or traffic lights. The value for \( N \) specifies the output status requested as shown in Table 7-11. Receipt of any #620N command automatically disables command #621 Predefined Output Control.
Table 7-11 Output Control Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Output Control Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>6200</td>
<td>Turn off both output ports</td>
</tr>
<tr>
<td>6201</td>
<td>Turn off output1, Turn on output0</td>
</tr>
<tr>
<td>6202</td>
<td>Turn off output0, Turn on output1</td>
</tr>
<tr>
<td>6203</td>
<td>Turn on both output ports (factory default)</td>
</tr>
</tbody>
</table>

Reader response:

Done

621 Select Predefined Output Control (Factory Default)

Command #621 configures the reader for predefined output mode. In this mode, both output lines – output0 and output1 – are automatically asserted upon receipt of a valid unique tag ID. The output line remains asserted for the time specified by output pulse duration (#67N Set Output Pulse Duration). Any direct control command (#620N Output Control) automatically disables the predefined output mode.

Reader response:

Done

63 Reset Reader

Command #63 resets the power fail bit, clears all buffers, resets tag uniqueness, turns off both output lines, transmits the sign-on message, and returns to the data mode.

Note: This command does not reset any other configuration parameters.

Reader response:

Model E4 Series Ver X.XX SNYYYYYY
Copyright 2008 TransCore

where

X.XXD Version number
YYYYYY Serial number of the unit, skipping the fourth character printed on the reader product label.

640N RF Control

Command #640N directly controls the RF module. The N value controls the RF power as shown in Table 7-12.
Commands

Table 7-12 RF Control Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>RF Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>6400</td>
<td>Turns off RF</td>
</tr>
<tr>
<td>6401</td>
<td>Turns on RF</td>
</tr>
<tr>
<td>6402</td>
<td>Turns on continuous wave (CW) RF until command 6400 or 641 is received by the reader.</td>
</tr>
</tbody>
</table>

Command #6400 disables RF-by-input control command #641 Select RF-by-Input Control.

Reader response:

Done

641 Select RF-by-Input Control (Factory Default)

Command #641 configures the reader for RF-by-input control. The reader automatically turns on RF when it detects a presence through sense0. The reader turns off RF according to the selected RF control algorithm (#692N Select RF Control Algorithm).

Reader response:

Done

642NN Select RF Operating Frequency

Caution

The authorized bands in the U.S. for CW frequency (i.e., ATA only) is 902.25 to 903.75 MHz and 910.00 to 921.50. The authorized frequency band for modulated frequency is 911.75 to 921.75 MHz.

Note: RF frequency can be set for backward-compatibility using command #642NN or for the newer 250-kHz step method using command #647XXX.

Command #642NN sets the reader RF frequency from 902 to 928 MHz in 500-kHz steps, where NN is a hexadecimal value from 00 to 34. After the reader’s frequency is set, the value is stored in battery-backed RAM (non-volatile RAM, NVRAM). This value is NOT altered by power-down, loading default parameters, or a flash download of new software (there is no default frequency value). It can only be changed by issuing command #642NN.

Additionally, if the NVRAM becomes corrupted, the correct operating frequency cannot be guaranteed. In this circumstance, the RF section will shut down and the reader will send an error message to the host (Error 06). Until the frequency is reset using command #642NN after NVRAM corruption, the unit will display the same
error message every time it is powered up or if an attempt is made to enable the RF (by host or by external sensor).

The commands to set the RF frequency are listed in Table 7-13.

Table 7-13  RF Frequency Commands

Reader message:

Done

643NN Select ATA Operating Range (Distance)

Command #643NN selects the read range for ATA tags where NN is a hexadecimal value from 00 to 1F; the range increases with increasing NN value. The range can be adjusted for 32 discrete values where 00 is the shortest range and 1F is the longest range. The default range value is 1F.

Reader response:

Done

644NN Set RF Attenuation

Command #644NN sets the attenuation control for the output RF power where NN is a hexadecimal value from 00 to 0A. Settings for attenuation are 1.0 dB increments over a range of 10 dB of attenuation from the maximum power setting of two watts at 0-dB attenuation to a minimum power level of 200 milliwatts at 10-dB attenuation.

The Set RF Attenuation command NN variables and corresponding attenuation settings are shown in Table 7-14.

Table 7-14  RF Attenuation Command Variables

Reader response:

Done
**645NN Set eGo and eGo Plus Operating Range (Distance)**
Command #64 5NN sets the read range for eGo and eGo Plus Tags where NN is a hexadecimal value from 00 to 1F; the range increases with increasing NN value. The range can be adjusted for 32 discrete values where 00 is the shortest range and 1F is the longest range. The default range value is 1F.

Reader response:

Done

**646XX Set IAG RF Attenuation**
Command #64 6XX sets the IAG attenuation control for the output RF power where XX is a hexadecimal value from 00 to 0F. Setting 00 (0 dB) is the maximum power setting and 0F (15 dB) is the minimum power setting. The default range value is 04.

**647XXX Select RF Operating Frequency**
Command #64 7XXX sets the reader RF from 860 to 930 MHz in 250-kHz steps, where XXX is a hexadecimal value from 000 to 118. After the reader’s frequency is set, the value is stored in non-volatile RAM (NVRAM). This value is not altered by power-down.

If the NVRAM becomes corrupted, the correct operating frequency cannot be guaranteed. In this circumstance, the RF section shuts down and the reader sends an Error 06 message to the host. Until the frequency is reset using command #64 7XXX, the unit displays the same error message every time it is powered up or if an attempt is made to enable the RF by host or by external sensor.

The commands to set the RF frequency are presented in Table 7-15.

Reader response:

Done

65 Reset Power Fail Bit

Command #65 resets the power fail bit to 0. The bit changes from 0 to 1 when power is restored to the reader. Upon reader power-up, the host transmits either command #65 or #63 Reset Reader to properly initialize this bit. The current state of the power fail bit may be displayed. Refer to “520 Display Power Fail Bit” on page 7-18 for more information.

Reader response:

Done
66F Load Default Operating Parameters
Command #66F loads all the factory default operating parameters except RF operating frequency. Refer to Table 8-2, Encompass 4 Reader Default Configuration Settings” for a listing of the defaults.

Reader response:
- **Done**: All parameters loaded OK
- **Error**: A parameter load failed

67N Set Output Pulse Duration
Command #67N sets the output pulse duration for the command #621 Predefined Output Control. This command specifies the length of time that output line(s) will be asserted upon receipt of a valid and unique tag ID. The factory default setting is 228 ms. The variable \( N \) specifies an output pulse duration of 48 ms to 752 ms.

Uppercase or lowercase characters are allowed for \( N \); for example, hex digits A through F or a through f. The command numbers and corresponding output pulse durations are shown in Table 7-16.

**Table 7-16 Output Pulse Duration Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
<tr>
<td>67D</td>
<td>300</td>
</tr>
<tr>
<td>67E</td>
<td>376</td>
</tr>
<tr>
<td>67F</td>
<td>752</td>
</tr>
</tbody>
</table>
Additional IDs may be acquired during the selected output pulse duration; however, the timing restarts upon each successive ID acquisition. This command should be used with discretion. For example, when the tag acquisition interval is short compared to the selected pulse duration, distinct pulses may not be generated.

Reader response:

Done or Error

**690N Select Presence Without Tag Report Option**

Command #690N enables or disables the presence without tag report option. If the presence without tag reporting option is enabled using command #6901, input reports are transmitted when a tag presence is detected without the subsequent acquisition of a valid tag. The value for N specifies the reports as shown in Table 7-17.

<table>
<thead>
<tr>
<th>Command</th>
<th>Report Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>6900</td>
<td>Disable presence without tag reports (factory default)</td>
</tr>
<tr>
<td>6901</td>
<td>Enable presence without tag reports</td>
</tr>
</tbody>
</table>

Reader response:

Done

Refer to “Basic Protocol and ECP Format” on page 6-5 for message format information.

**692N Select RF Control Algorithm**

Command #692N selects the algorithm for turning off RF power when RF-by-input control is enabled using command #641 Select RF-by-Input Control.

The values for N specify the RF control algorithms as shown in Table 7-18.

<table>
<thead>
<tr>
<th>Command</th>
<th>RF Power Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>6920</td>
<td>On timeout only</td>
</tr>
<tr>
<td>6921</td>
<td>Timeout or tag ID acquired</td>
</tr>
<tr>
<td>6922</td>
<td>Timeout or presence false (factory default)</td>
</tr>
</tbody>
</table>

Command #6920 turns off RF power based on the timeout established by command #693N Set RF Timeout Period.

Command #6921 allows RF power to be turned off either after the timeout period or upon acquisition of a valid tag ID, whichever occurs first.
Command \#6922 turns off RF power either after the timeout period or upon the presence false condition, whichever occurs first.

Reader response:

Done

693N Select RF Timeout Period

Command \#693N selects the RF timeout period used by command \#692N Select RF Control Algorithm. Values for N range from 0 through F. Command \#693F disables the RF timeout. The reader turns off the RF immediately following the acquisition of a valid tag, whether or not it is unique. This control algorithm may be used in Wiegand mode to ensure that the tag data is transmitted once and only once per presence on both serial and Wiegand ports.

Uppercase or lowercase characters are allowed for N; for example, hex digits A through F or a through f. The commands and corresponding timeouts are shown in Table 7-19.

Table 7-19 Timeout Period Values

</tr>
<tr>
<td>693F</td>
<td>Infinite (never expires, factory default)</td>
</tr>
</tbody>
</table>
Reader response:

Done or Error.

The reader returns an Error message if a valid hexadecimal digit is not substituted for N in command #693N.

694N Select Input Inversion Option

Command #694N enables or disables input inversion. When inversion is enabled, an open circuit input is interpreted as a closed circuit, and a closed circuit input is interpreted as an open circuit. This feature allows greater flexibility in the attachment of external equipment to the reader inputs. For example, some proximity sensors indicate presence with an open circuit. In this instance, command #6941 can enable input inversion so that an open circuit input indicates a presence. The values for N represent the two inversion options as shown in Table 7-20.

Table 7-20  Input Inversion Options

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td>6940</td>
<td>Disable input inversion (factory default)</td>
</tr>
<tr>
<td>6941</td>
<td>Enable input inversion</td>
</tr>
</tbody>
</table>

Reader response:

Done

695S...S Set Serial Number

Command #695 assigns the reader serial number according to the format:

695SSSSSSS

where SSSSSS is the serial number.

The serial number may contain as many as six uppercase or lowercase ASCII alphanumeric characters.

Note: The factory-assigned serial number of the reader contains seven characters. However, to maintain backward compatibility, the reader software allows only six characters to be entered. When setting the serial number, skip the fourth (middle) character of the seven-character number shown on the reader product label.

Note: Once assigned, the serial number is preserved during power-down and the loading of default parameters.

Reader response:

Done

696S...S Store Hardware Configuration String

Command #696S...S stores hardware configuration information into reader memory.
The hardware configuration string is assigned according to the following format:

```
696S...S
```

where S...S is the hardware configuration string that may contain as many as 20 uppercase or lowercase ASCII alphanumeric characters.

*Note:* Once assigned, configuration information is preserved during power-down and the loading of default parameters.

Reader response:

```
Done
```

---

**Auxiliary Reader Control — Command Group 8**

Group 8 commands provide control of reader functions, such as the sense input lines.

**82N Select Input Status Change Report Option**

Command #82N selects the input lines to be monitored to report any change in input status. The enabled input lines are monitored for any changes in the logic states. If a change is detected, the reader generates an input status change message and treats it as a tag ID. If the auxiliary information option is enabled, the input status field displays the current input values. The value for N specifies the report options as shown in Table 7-21.

**Table 7-21 Input Status Change Report Options**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
<tr>
<td>823</td>
<td>Report changes on input0 and input1</td>
</tr>
</tbody>
</table>

Reader response:

```
Done
```

**830 Disable Automatic Periodic RF Status Report (Factory Default)**

Command #830 is a default set in the factory to disable the automatic periodic RF status report.

Reader response:

```
Done
```
831 Enable Automatic Periodic RF Status Report

Command #831 enables the automatic periodic RF status report. This function sends out a periodic RF status report if no other message (a tag read) is sent from the reader for a period of time. This message is the same message that would be sent in response to the #527 Display RF Status command. Enabling this function is helpful in some sites where there may not be much tag activity, and the user wants an automatic way to ensure the communication channel with the reader is still intact. With this function enabled, the host system will get a message from the reader at least every three minutes.

Reader response:

Done
Configuring the Encompass 4 Reader
Configuring the Encompass 4 Reader

This chapter provides instructions for configuring the Encompass® 4 Reader, including factory configuration parameter defaults and instructions for using terminal emulation software to check and change the Encompass 4 Reader factory configuration defaults.

Configuring the Reader

After installing the Encompass 4 Reader, you need to configure its operating parameters. Terminal settings should be initially set at 9600 baud, 8 data bits, no parity, 1 stop bit, and no flow control.

General Configuration Labeling

Each Encompass 4 Reader and its shipping carton are labeled to indicate the unit’s general configuration. Table 8-1 contains explanations of the Encompass 4 Reader label fields.

Table 8-1  Encompass 4 Reader Configuration Label Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st</td>
<td>TransCore reader designator</td>
</tr>
<tr>

<td>019 = IAG protocol</td>
</tr>
</tbody>
</table>

As an example, a label reading 10-4002-004 indicates that this 915-MHz Encompass 4 Reader is configured with an integrated antenna, RS–232 and Wiegand communications, and reads SeGo and IAG protocol tags.
Default Operating Parameter Settings

Table 8-2 contains the factory default configuration settings for the Encompass 4 Reader operating parameters. The default configuration settings may not be the correct operating configuration settings for a specific site. Changes to the configuration settings may have to be made, depending on the site plan, as described in Chapter 2 “Developing the Site Plan.”

Review the default configurations shown in Table 8-2 to determine which parameters, in addition to operating frequency and operating range, need to be adjusted. Refer to Chapter 7, “Commands,” for a complete list of parameters and the corresponding commands.

*Note:* The dual-protocol Encompass 4 Reader internal timing varies depending on the operative tag read mode and the type of tag in the read field.

Configuring Parameters with Terminal Emulation Software

To configure the Encompass 4 Reader using a PC and terminal emulation software to manually enter Encompass 4 Reader host commands, follow the instructions in the section “Connecting the Encompass 4 Reader to the PC” on page 4-23. Then, enter the appropriate configuration commands through the terminal emulation software on your PC.

a. Local laws apply. The authorized frequency band for the TransCore Encompass 4 Reader in the United States is 911.75 MHz to 919.75 MHz. Contact TransCore if your application requires a frequency outside of this range.
See Chapter 7, “Commands,” for a detailed description of all available configuration commands.

---

**Starting the Terminal Emulation Software**

You can use a PC and any terminal emulation software to enter the host commands to download flash software, configure reader operating parameters, perform diagnostics, and retrieve tag data. The following procedures show examples using Hyper Terminal™, an application included with Microsoft Windows. Most terminal emulation applications have a similar sequence for launching.

**To start the terminal emulation software**

1. At the command prompt, type your terminal emulation start command; or if using Windows Hyper Terminal, select:
   
   **Programs>Accessories>Hyperterm**
   
   and press **ENTER**.

   The application displays the Connection Description dialog box as shown in Figure 8-1.

   ![Connection Description Dialog Box](Image)

   **Figure 8-1 Connection Description Dialog Box**

2. Enter a name for the session and click **OK**.

   The application displays the **Phone Number** dialog box as shown in Figure 8-2.
3. From the **Connect using** pull-down list, choose the **Com 1** option (or whichever com port on the PC to which the RS-232 cable is attached) and click **OK**.

The application displays the **COM1 Properties** dialog box as shown in Figure 8-3.

4. In the pull-down lists on the **COM1 Properties** dialog box, choose the following values:
   - Bits per second: 9600 baud
   - Data bits: 8
Verifying Communications

You must verify that the Encompass 4 Reader and the PC or laptop are communicating.

To verify communications
1. Start the terminal emulation application as described previously in “Starting the Terminal Emulation Software” on page 8-6.

   Note: When testing the Encompass 4 Reader using a laptop, TransCore recommends that you configure laptop communication parameters to match those of the host computer to which the Encompass 4 Reader will be connected after testing and configuration are completed.

2. Cycle the power on the Encompass 4 Reader.
Upon startup, the Encompass 4 Reader transmits a sign-on message, displayed on the terminal emulation screen as shown in Figure 8-5, or a boot ROM failure message.

![Figure 8-5  Sign-on Message](image)

**Figure 8-5  Sign-on Message**

The sign-on message appears as follows:

```
Model [software version] SNYYYYYY
[Copyright notice]
```

where YYYYYY is the serial number assigned to the Encompass 4 Reader skipping the fourth character printed on the reader product label.

Serial number 000000 is the default setting and is not a valid number. If this number appears in the sign-on message, the serial number has never been stored into reader memory. Contact TransCore Technical Support.

If the flash memory checksum is not verifiable, the sign-on message appears as follows:

```
Model [E4 BOOT] Ver 0.00 A
[Copyright notice]
```

If the failure message version number equals 0.00 E and no serial number exists, the flash memory checksum has failed, and the Encompass 4 Reader is operating out of boot ROM. In this case, the Encompass 4 Reader automatically enters download mode and waits for a new program to be loaded into the flash memory. Follow the instructions in “Program Download” on page 5-5.

Communications can also be verified by using the command sequence in Table 8-3.
Table 8-3  Command Sequence to Verify Communications

<table>

<td>Returns the Encompass 4 Reader to data mode.</td>
</tr>
</tbody>
</table>

3. If a successful sign-on message is not returned, check connections and communications factors and correct any errors.

To check connections and communications factors
1. Confirm that the Encompass 4 Reader has power.
2. Verify the connections between the PC and the Encompass 4 Reader.
3. Verify the receive (Rx) and transmit (Tx) connections.
4. If using handshaking, verify the RTS and CTS connections.
5. Verify the COM port settings for the Encompass 4 Reader using the instructions in “Serial Port Communications” on page 8-18.

Repeat the procedures in “Verifying Communications” on page 8-8.

If you still cannot verify the Encompass 4 Reader and PC communications, use the information in “Technical Support” on page 9-6 to contact TransCore.

Verifying Tag Read Capability
After verifying communications between the Encompass 4 Reader and the PC, verify the capability to read tags.

Note: The default tag read mode of the reader is the protocol(s) programmed into the reader. Table 8-1 shows how to determine which tag protocol(s) your Encompass 4 reader supports. Use only those test tags programmed with the correct protocol(s) for the reader.

Caution
To avoid damage to the Encompass 4 Reader using an external antenna, you must connect the antenna before applying power to the reader.

To verify tag read capability
1. Once communications are verified as described in “Verifying Communications” on page 8-8, enter the following sequence of commands to turn on continuous RF:
   - #01
   - #6401
2. Pass one test tag in front of the unit. If the Encompass 4 Reader reads the tag, the terminal emulation application displays the tag information on the screen as shown in Figure 8-6.

If the tag ID is not displayed, perform the following actions:

- Verify that the Encompass 4 Reader is in data mode (command #00 Switch to Data Mode).

- Ensure that the tag you are using is compatible with the Encompass 4 Reader. The Encompass 4 Reader can read tag types that are compatible with the reader model.

- An Encompass 4 Reader displays the tag read for any tag that is compatible with the reader programming. Table 8-1 shows how to determine which tag protocol(s) your Encompass 4 reader supports.

- Using the audible circuit tester as described in “Testing the Encompass 4 Reader Using an Audible Circuit Tester” on page 4-5, verify that the reader is capable of reading the tag in the read zone. If it is, the problem is probably in the communications between the Encompass 4 Reader and the host.

3. Pass a different reader-compatible test tag in front of your Encompass 4 Reader.

4. When the Encompass 4 Reader reads the second tag successfully, the terminal emulation application displays that tag’s information in the main screen below the information for the first tag, as shown in Figure 8-7.
Figure 8-7  Second Successful Tag Read

If the read is unsuccessful, perform the following actions:

• Ensure the tag you are using is compatible with the Encompass 4 Reader.

• Using the audible circuit tester as described in “Testing the Encompass 4 Reader Using an Audible Circuit Tester” on page 4-5, verify that the reader is capable of reading the tag in the read zone. If it is, the problem is probably in the communications between the Encompass 4 Reader and the host computer.

Configuring Encompass 4 Parameters

Follow the procedures in this section to configure Encompass 4 parameters using a PC, laptop, or terminal emulator. The PC or laptop must be connected to and communicating with the Encompass 4 Reader, and the terminal emulation application must be configured correctly, as described in the section “Verifying Communications” on page 8-8.

Note: If you are using Wiegand mode, you must connect the PC or laptop to the Encompass 4 Reader using the RS–232 or RS–422 interface before attempting to send commands to the reader. You can leave the Wiegand interface connected during this procedure.

To configure parameters

1. Switch to command mode by typing #01 at the prompt on the terminal emulation screen, and pressing ENTER.

Note: All Encompass 4 Reader commands are preceded by the start-of-message character (#).

2. To meet requirements of your site, make changes to default operating parameters as described in the following sections.

The following sections contain procedures to set some of the parameters that are commonly changed to meet the requirements of a specific site. Procedures are listed in alphabetical order by parameter.
**Appended Tag Data**

Use this procedure to set appended tag data parameters using the terminal emulation application. See “31N Append Auxiliary Information Selection” on page 7-9 for more information.

To set appended tag data parameters

1. Ensure that the host computer is in command mode.

2. Enter command #311 to append auxiliary information or command #310 to have no auxiliary information appended (factory default). Press ENTER.

**ID Separation**

The host can select a unique ID separation of one ID or two IDs. The reader default operation is for a unique ID separation of one ID and a uniqueness timeout of two minutes. You can disable the uniqueness check using command #40 Transmit All ID Codes. In this case, every tag ID received is transmitted without regard to uniqueness. You can reinstate uniqueness checking with commands #4100 or #4101 Select ID Separation.

*Note:* The dual-protocol Encompass 4 Reader internal timing varies depending on the operative tag read mode and the type of tag in the read field.

See section “40 Transmit All ID Codes” on page 7-10 and section “410N Select Unique ID Code Criteria (Anti-passback Feature)” on page 7-11.

To set ID separation parameters

1. Ensure that the host computer is in command mode.

2. Enter command #4100 to select a separation of one ID; enter command #4101 to select a separation of two IDs. Press ENTER.

**Reports**

The Encompass 4 Reader can be configured to transmit presence without tag reports and input status change reports. A presence without tag report is transmitted in data mode only, and only if the system has a presence detector. This report is sent if a presence is detected without the detection of a valid tag ID. See sections “529 Display Presence Input Status” on page 7-24 and “690N Select Presence Without Tag Report Option” on page 7-42.

If configured with command #82N Select Input Status Change Report Option to transmit input status change reports, the reader will transmit a message to the host computer any time the inputs change state. Input status change reports are transmitted in data mode only. Input status change reporting is disabled by default. See sections “560 Request Sensor Status Change” on page 7-28 and “82N Select Input Status Change Report Option” on page 7-45. Also refer to Chapter 6, “Communications Protocols” for information on message formats.
To set presence reporting
1. Ensure that the host computer is in command mode.
2. Enter command #529 to display presence input status and press ENTER. P0 indicates presence without tag reports disabled (factory default), and P1 indicates presence without tag reports enabled.
3. Enter command #6901 to enable presence without tag reports, or enter command #6900 to disable presence without tag reports (factory default). Press ENTER.

To set input status change reporting
1. Ensure that the host computer is in command mode.
2. Enter command #560 to display input status change report options and press ENTER.
   - EO = input status change reports disabled (factory default)
   - E1 = input status change reports enabled
   - M0 = reporting disabled (factory default)
   - M1 = changes on input0 reported
   - M2 = changes on input1 reported
   - M3 = changes on either input reported
3. Enter command #821 to report any change on input0, command #822 to report any change on input1, command #823 to report changes on input0 and input1, or command #820 to disable status change reports (factory default). Press ENTER.

Reset Reader
Command #63 Reset Reader resets uniqueness, clears the power fail bit, and transmits the sign-on message. The reader returns to data mode following the completion of this command.

Note: This command does not reset any of the configuration parameters.

See “63 Reset Reader” on page 7-34.

To reset the reader
1. Ensure that the host computer is in command mode.
2. Enter command #63. Press ENTER.
   The terminal emulation screen displays the sign-on message as shown in Figure 8-5 on page 8-9.
Radio Frequency

Caution
The authorized continuous wave (CW) frequency band for the Encompass 4 Reader in the U.S. is 902.25 to 903.75 MHz and 910.00 to 921.50 MHz. The authorized modulated frequency band for the Encompass 4 Reader in the U.S. is 911.75 to 919.75 MHz. The RF for each Encompass 4 Reader at the site must be set according to the frequency specified in the FCC site license. Only trained, authorized installation and maintenance personnel are permitted by FCC to set the RF.

By using the Encompass 4 Reader an authorized person can set the frequency within the range from 902 to 928 MHz in 0.25 MHz steps. You can set the frequency by using a terminal emulation program and issuing the frequency command, as discussed in section “647XXX Select RF Operating Frequency” on page 7-39.

Note: For backward compatibility to existing controllers, you can set the RF operating frequency in 500-kHz steps using command #642NN.

To set the frequency range
1. Ensure that the host computer is in command mode.
2. Enter command #647XXX – where XXX is a hexadecimal value from 000 to 118 – and press ENTER. See command “647XXX Select RF Operating Frequency” on page 7-39 for a complete listing of the hexadecimal values and the corresponding frequencies. For backward compatible frequency selection, see command “642NN Select RF Operating Frequency” on page 7-35.
3. To verify that the RF has been changed to the proper setting, type in command #527 to see the current frequency setting.

Caution
Contact TransCore if your application requires a frequency outside of the authorized frequency range.

RF Transmission
The RF transmission can be controlled by one of the following methods:

• Connecting a vehicle detector to the sense input0 circuit
• The host sending software commands to the Encompass 4 Reader

As a factory default, the Encompass 4 Reader is configured to control the RF power with a vehicle detector.

Figure 8-8 illustrates the methods of controlling RF sense output.
Figure 8-8 Encompass 4 Reader RF Control Options

Vehicle Detector Controlling RF Transmission

The vehicle detector can be a loop detector, an infrared sensor, or an ultrasonic detector that is connected to sense input0 to turn on the Encompass 4 Reader RF transmitter. In Figure 8-8, Option A shows a vehicle detector controlling the RF transmitter. This operation is preferred because the RF transmits only when a vehicle is in the Encompass 4 Reader read zone. Command #641 Select RF-by-Input Control (factory default) must be enabled.

To set the option of the vehicle detector controlling the Encompass 4 Reader
1. Ensure that the host computer is in command mode.
2. Enter command #641. Press ENTER.

Leave the setting on RF-by-input control for normal operation.

Host Controlling RF Transmission

In Figure 8-8, Option B shows the host controlling the RF transmitter.

If the vehicle detector is connected to the host computer, as shown in Option B, commands #6400 RF Off and #6401 RF On sent from the host computer turn on and off the Encompass 4 Reader RF transmitter.

Continuous RF Transmission

In Figure 8-8, Option C shows the test configuration controlling the RF transmitter. To test the Encompass 4 Reader, as described in “Testing the Encompass 4 Reader Using an Audible Circuit Tester” on page 4-5, you can turn on the Encompass 4 Reader RF transmitter continuously by issuing command #6401.
You may also use command \#6402 to turn on CW RF for diagnostic purposes. Entering this command transmits a continuous RF signal at the output frequency and attenuation level as specified in the respective associated commands until command \#6400 RF Off, \#6401 RF On, or \#641 Select RF-by-Input Control is received by the reader. Tags are not read in CW mode. See “640N RF Control” on page 7-34 for more information.

**Sense Inputs**

Both the RS–232 and RS–422 configurations used by the Encompass 4 Reader have two sense inputs — sense input0 and sense input1. The default configuration uses sense input0 as the presence detection device line. RF power is automatically turned on only when the presence detection device (loop detector or other device) detects a presence. Sense input1 is not used directly by the reader; it is used by the host computer to monitor an external device. The Encompass 4 Reader sense inputs are designed to connect to a dry contact closure.

You can configure the Encompass 4 Reader to generate input status change reports, which are transmitted like tag IDs. The host can then respond based on the true/false (closed/open) status of the sense inputs. See the section “Reports” on page 8-13.

The following procedures describe how to set sense inputs using the terminal emulation software. See commands “526 Display I/O Status” on page 7-21, “694N Select Input Inversion Option” on page 7-44, and “82N Select Input Status Change Report Option” on page 7-45 for more information.

**To set sense inputs**

1. Ensure that the host computer is in command mode.

2. Enter command \#526 to display the current input/output status. C0 = host controls outputs; C1 = predefined output mode; O0 = both outputs off; O1 = output0 on; O2 = output1 on; O3 = both outputs on; I0 = both inputs false; I1 = input0 true; I2 = input1 true.

3. Enter command \#6940 to disable input inversion (factory default) or command \#6941 to enable input inversion, and press ENTER.

**Sense Output Devices**

Both the RS–232 and RS–422 configurations used by the Encompass 4 Reader have two sense output circuits – sense output0 and sense output1.

By default, the Encompass 4 Reader operates in predefined output mode where sense output0 and sense output1 are asserted every time a unique valid tag is read. Both sense output devices are asserted by issuing command \#621 Predefined Output Control. The devices are not asserted when tags are acquired in the transmit all or buffer all ID mode or when the Encompass 4 Reader is operating in Wiegand mode. The sense output pulse duration is variable (command \#67N).

The host computer can disable the predefined sense output control by issuing command \#6201 to turn sense output0 on or by issuing any of the following commands: \#6200 Turn Off Both Output Ports, \#6201 Turn Off Output0, On Output1, \#6202
Turn Off Output1, On Output0, or \#6203 Turn On Both Output Ports. While under host control, the sense outputs are not automatically asserted when a valid tag is read. The host must issue command \#621 Predefined Output Mode to return to the predefined mode.

**Serial Port Communications**

The Encompass 4 Reader supports one communications port, which can be ordered as either RS–232/Wiegand or RS–422/Wiegand. For the RS–232 and RS–422 communications specifications, the Encompass 4 Reader maintains the following three sets of parameters that affect serial port communications:

- Port configuration parameters (baud rate, data bits, stop bits, parity)
- Communications protocols (basic, error correcting)
- Flow control scheme (none, software, hardware)

The default serial port configuration for each of these three parameters is as follows:

- 9600 baud, 8 data bits, 1 stop bit, no parity
- Basic communications protocol
- Software flow control (XON/XOFF)

You can change these parameters in data mode and command mode operation by issuing commands with the host computer. Use the following procedures to set serial port communications parameters using the terminal emulation program.

**Port Configuration Parameters**

Use this procedure to set port configuration parameters using the terminal emulation program. Consult sections “100N Select Baud Rate” through “102N Select Parity” on page 7-7.

**To set baud rate**

1. Ensure that the host computer is in command mode.
2. Enter command \#100N and press ENTER.

**To set stop bits**

1. Ensure that the host computer is in command mode.
2. Enter command \#101N and press ENTER.

**To set parity**

1. Ensure that the host computer is in command mode.
2. Enter command \#102N and press ENTER.
Communications Protocol

Use the following procedures to set communications protocol. Consult sections “610 Select Basic Communication Protocol (Factory Default)” through “612NN Select Error Correcting Protocol Timeout” on page 7-30 for more information.

Caution

Do not switch to ECP (command #611) unless the host is prepared to acknowledge each reader transmission.

To select a communications protocol

1. Ensure that the host computer is in command mode.
2. Enter command #610 to select basic protocol (factory default) or command #611 to select ECP and press ENTER.

Software Flow Control

Two modes of flow control are supported — software (XON/XOFF) and hardware (CTS - clear to send). The host can enable or disable flow control with command #614N Select Flow Control Option.

The host can use software control characters (XON/XOFF) or the hardware CTS handshake line to interrupt reader transmissions. When the reader is configured for software flow control, it stops transmitting if it receives the XOFF character from the host (host software command 13H). It resumes transmitting only when it receives the XON character (host software command 11H) from the host. Likewise, when the reader is configured for hardware flow control, it stops transmitting if it detects that the CTS line is no longer asserted. It resumes transmitting when this line is asserted. If flow control is not needed, the reader should be configured for no flow control (#6140 Disable Flow Control).

Note: TransCore recommends that XON/XOFF flow control be disabled while using the error correcting protocol.

Use the following procedure to set flow control parameters using the terminal emulation program. See section “614N Select Flow Control Option” on page 7-31.

To select flow control

1. Ensure that the host computer is in command mode.
2. Enter command #6140 to disable flow control, command #6141 to enable software flow control (factory default), or command #6142 to enable hardware flow control and press ENTER.

Fine-Tuning and Verifying the Read Zone

If the read zone is too wide or too deep for your application, it can be fine-tuned by physically adjusting the Encompass 4 Reader or external antenna mounting orientation, reprogramming the actual RF power output (#644NN Set RF Attenuation), and/
or reprogramming the RF sensitivity range (#643NN Set ATA Operating Range and #645NN Set eGo and eGo Plus Operating Range). The combination of these adjustments allows you to confine the read zone to the area where tagged vehicles pass. This operation also minimizes reading unwanted vehicles in adjacent lanes or parking areas.

See sections “643NN Select ATA Operating Range (Distance)” on page 7-38, “645NN Set eGo and eGo Plus Operating Range (Distance)” on page 7-39, and “644NN Set RF Attenuation” on page 7-38 for more information.

Note: As described in “Marking the Read Zone” on page 4-29, marking the read pattern using test tags that are not mounted to vehicles give a general idea of the read pattern but the pattern will vary somewhat when actual vehicles with tags are tested. Final adjustments must be made with tags properly mounted on a variety of vehicles.

**Physically Orienting the Encompass 4 Reader**

You can manually adjust the location of the read zone by loosening the Encompass 4 Reader mounting brackets and pointing the reader in the desired direction. The unit should be aligned to point directly at the tag as it enters the desired read zone.

**Physically Orienting the Encompass 4 Reader Antenna**

You can manually adjust the location of the read zone by loosening the antenna mounting brackets and pointing the antenna in the desired direction. The unit should be aligned to point directly at the tag as it enters the desired read zone.

**Fine-Tuning the Read Zone by Lowering Output Power**

You can make the read zone smaller by adjusting the Encompass 4 Reader RF power output from a maximum of 2 watts to a minimum of 200 milliwatts using command #644NN Set RF Attenuation. Lowering the RF power has the added benefit of reducing RF interference with adjacent lanes.

To adjust the read zone by lowering output power

1. Ensure that your PC is communicating with the Encompass 4 Reader using a terminal emulation program as described in section “Verifying Communications” on page 8-8.
2. Mark the current read zone as described in section “Marking the Read Zone” on page 4-29.

Caution

Test tags should be compatible with your Encompass 4 Reader. Test tags can be ATA-protocol, ISO-compliant, or Inter-Agency Group tags affixed to a plastic or wooden yardstick, or eGo or eGo Plus sticker-type tags affixed to a piece of nonmetallic windshield-type glass 0.190 to 0.230 in (4.82 to 5.84 mm) in thickness. The sticker-type tags have a reduced read range when not attached to glass.

3. Enter command #01 to switch to command mode. You are prompted with #DONE from the reader and can now enter reader commands.
4. Enter in command #64401 to lower the RF power by 1 dB below 2 watts (default). Press ENTER.
Note: In the command #644NN, NN can be any hexadecimal value from 00 to 0A. Settings for attenuation are 1.0 dB increments over a range of 10 dB of attenuation from the maximum power setting of 2 watts at 0 dB attenuation to a minimum power level of 200 milliwatts at 10 dB attenuation. Increasing the attenuation lowers the output RF power.

5. Switch to data mode by entering command #00 and pressing ENTER.

6. Verify that the read zone has decreased by moving the tag through the desired read area. If the read zone is still too large, switch to command mode and enter the command #64402 to lower the output RF power another 1 dB. Continue increasing the NN value until the read zone matches the desired read zone.

7. Follow the steps in “Procedures” on page 4-30 to mark the new read zone on the ground with tape or chalk.

When the desired read zone is established, test the read zone with simulated and real traffic by performing the following procedures:

To test the read zone
1. Ensure that the Encompass 4 Reader is in data mode.

2. With the Encompass 4 Reader running, place one tag behind your back while you hold another tag in the new read zone. If a valid read, the data from the tag held in the read zone displays on the PC screen.

3. Switch tags, placing the other tag behind your back and holding the first tag in the read zone. If a valid read, the data from this tag held in the read zone displays on the PC screen. If both tags are read, you have successfully adjusted the read range.

4. If one or both tags did not read, follow the suggestions in “Verifying Tag Read Capability” on page 8-10.

5. As a last test, attach test tags to vehicles and simulate traffic going through the read zone to verify that the system performs accurately in a live environment.

Fine-tuning the Read Zone by Adjusting Sensitivity Range

The Encompass 4 Reader read zone can be fine-tuned by using command #643NN for ATA tag read mode or #645NN for eGo and eGo Plus tag read mode to reprogram the RF sensitivity range. Sensitivity range adjustments have less impact on the read pattern than RF power adjustment, thus RF power adjustment should be used as the main read pattern adjustment tool. Sensitivity range control may be helpful in stopping some tag reads on the very edges of the read pattern. To produce a noticeable change in the read pattern, you must decrease the range sensitivity by more than one increment.

To adjust the read zone by adjusting sensitivity range
1. Ensure that your PC is communicating with the Encompass 4 Reader using a terminal emulation program as described in “Verifying Communications” on page 8-8.

2. Mark the current read zone as described in “Marking the Read Zone” on page 4-29.
3. Enter command #01 to switch to command mode. You are prompted with #DONE from the reader and can now enter reader commands.

4. Enter command #64318 or #64518 to decrease the range sensitivity seven increments below the maximum (default). Press ENTER.

Note: In the command #643NN or #645NN, NN can be any hexadecimal value from 00 to 1F. The reader’s receiver becomes less sensitive to tag signals as the value of NN is lowered from the maximum sensitivity of 1F to the minimum sensitivity of 00.

5. Verify that the read zone has decreased by moving the tag through the desired read area. If the read zone is still too large, switch to command mode and enter the command #64317 or #64517 to decrease the range another increment. Continue increasing the NN value until the read zone matches the desired read zone.

6. Follow the steps in section “Procedures” on page 4-30 to mark the new read zone on the ground with the tape or chalk.

When the desired read zone is established, test the read zone with simulated and real traffic by performing the following procedures.

To test the read zone

1. Ensure that the Encompass 4 Reader is in data mode.

2. With the Encompass 4 Reader running, place one tag behind your back while you hold another tag in the new read zone. If a valid read, the data from the tag held in the read zone displays on the PC screen.

3. Switch tags, placing the other tag behind your back and holding the first tag in the read zone. If a valid read, the data from this tag held in the read zone displays on the PC screen.

4. If both tags are read, you have successfully adjusted the read range. If one or both tags did not read, follow the suggestions in “Verifying Tag Read Capability” on page 8-10.

5. As a last test, attach test tags to vehicles and simulate traffic going through the read zone to verify that the system performs accurately in a live environment.
Troubleshooting and Maintenance
This chapter contains information for troubleshooting an Encompass® 4 Reader and performing minimal maintenance checks. It also includes information for returning products for repair, obtaining support, and contact information for providing feedback and suggestions to TransCore.

Error Messages

The Encompass 4 Reader transmits an error message if a command received from the host is not a recognized command or if information supplied with the command is not correct. The reader sends this message to diagnostic commands if the reader fails the specified test.

*Table 9-1* contains a list of error messages.

**Table 9-1 Error Messages**

<tr>
<td>Error07</td>
<td>The RF phase locked loop (PLL) has lost lock and is unable to operate at its intended frequency. RF output is disabled while the Encompass 4 Reader attempts to reset the PLL.</td>
<td>Reset the RF frequency. Refer to “Radio Frequency” on page 8-15 for instructions.</td>
</tr>
<tr>
<td>Error08</td>
<td>The RF PLL has successfully regained lock and has been reset to its proper operating frequency. The RF section is returned to its state prior to losing lock (enabled/disabled). <em>Error08</em> will only be issued after <em>Error07</em> has been issued.</td>
<td>No action necessary; the previous error has been corrected.</td>
</tr>
<tr>
<td>Error11</td>
<td>The operator is attempting to use an Intellitag-based tag in Wiegand mode while the Encompass 4 Reader is in ID-only mode, thus Wiegand compatibility issues.</td>
<td>Enable eATA mode using command #489 if Wiegand operation is needed and the tags are programmed with Wiegand data.</td>
</tr>
</tbody>
</table>
Table 9-1 Error Messages (continued)

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Description</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ErrorRF1</td>
<td>Warning message that the RF board did not return an update acknowledge signal</td>
<td>If the reader indicates a single ErrorRF1 event and recovers from the error, no corrective action is required. You may want to track this error message if it should occur again. If the reader indicates repeated ErrorRF1 warning messages then return the reader to the factory.</td>
</tr>
<tr>
<td>ErrorRF2</td>
<td>Warning message that the RF module did not return an INIT DONE signal</td>
<td>If the reader indicates a single ErrorRF2 event and recovers from the error, no corrective action is required. You may want to track this error message if it should occur again. If the reader indicates repeated ErrorRF2 warning messages then return the reader to the factory.</td>
</tr>
<tr>
<td>ErrorRF3</td>
<td>Warning message of unexpected status read, including status byte, from RF module</td>
<td>If the reader indicates a single ErrorRF3 event and recovers from the error, no corrective action is required. You may want to track this error message if it should occur again. If the reader indicates repeated ErrorRF3 warning messages then return the reader to the factory.</td>
</tr>
</tbody>
</table>

Troubleshooting

You can use the following table for troubleshooting. Should problems continue, contact TransCore for return and replacement procedures. If you contact Technical Support, use the symptom number in Table 9-2 to reference the problem that you are having with the Encompass 4 Reader.

Table 9-2 Symptoms and Remedies

<table>
<thead>
<tr>
<th>Symptom Numbera</th>
<th>Symptom</th>
<th>Remedy</th>
</tr>
</thead>
</table>
| 1               | When performing a quick test of the Encompass 4 Reader, the buzz box does not buzz. | Check all your wiring connections and antenna connections (if using external antenna), and ensure that your buzz box is functioning. 
The wires from the Encompass 4 Reader are grouped in pairs. You could find more than one red wire, more than one black wire, and so on. You must connect the correct red and white wire pair to the leads from the battery. 
Verify that RF is on as described in “Bench Testing the Encompass 4 Reader Before Installation” on page 4-10. Using a terminal emulation program, you may switch to command mode and issue command #527 to determine RF status. See page 7-23 for more information. |
### Table 9-2  Symptoms and Remedies (continued)

<table>
<thead>
<tr>
<th>Symptom Number^a</th>
<th>Symptom</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>The baud rate is selected correctly but nothing happens.</td>
<td>The Encompass 4 Reader is not communicating with your PC. Check the power supply to your PC, and check the connections between the PC and the Encompass 4 Reader. Try reversing the receive and transmit connections.</td>
</tr>
</tbody>
</table>
| 3                | When testing the Encompass 4 Reader, all the wires are connected correctly but the unit does not respond. | The Encompass 4 Reader may not have the software loaded inside the unit. Contact Technical Support as described on page 9-6.  
If you are using a terminal emulation program, check that the terminal emulation setting on the Encompass 4 Reader is VT100.  
Check that the Encompass 4 communication cable is connected to the correct COM port.  
Verify that the external antenna is connected correctly. |
| 4                | Strange signal responses come from the Encompass 4 Reader when tested with the PC. | Ensure that the reader is in the correct interface mode for the test tag, i.e., Wiegand mode for a Wiegand tag.  
Check the system defaults using a terminal emulation program. Both PC and reader should be set to 9600 baud, 8 bits, 1 stop bit, and no parity. |
| 5                | When a tag is moved in front of the reader or external antenna, a clicking sound comes from the Encompass 4 Reader. | The Encompass 4 Reader works. The sound is the relay inside the Encompass 4 Reader that is controlled by a lock signal. The relay is actuated when a tag is in the read zone. |
| 6                | Nothing happens when the test tag is passed in front of the Encompass 4 Reader or external antenna. | Ensure that the Encompass 4 Reader is powered on and is in predefined output mode. (#621)  
Verify that the reader is set to RF ON (#6401).  
Verify that the external antenna is connected correctly. |
| 7                | The Encompass 4 Reader came from another site and does not work the way the factory defaults indicate that it should. | Different commands were probably used to support the other site’s specific configuration. You can restore the factory defaults by using a terminal emulation program to switch to command mode and issuing command #66F Load Default Operating Parameters. All factory defaults except RF frequency will be restored. |
| 8                | When connected to a PC that is running terminal communications software, a just-powered up Encompass 4 Reader displays one of the following messages: #Model E4 Series X.XX SNYYYYYY #[Copyright notice] | The Encompass 4 Reader works. The software is now loaded. YYYYYY is the TransCore-assigned serial number for this Encompass 4 Reader. However, if YYYYYY = 000000, a serial number has never been assigned. If a serial number has not been assigned to your Encompass 4 Reader, contact TransCore Technical Support. |

*a*Use this number to reference the problem you are having with the Encompass 4 Reader if you contact Transcore for Technical Support.

**Encompass 4 Reader Repair**

The Encompass 4 Reader is designed for whole-unit replacement and is manufactured with surface-mounted components. It requires sophisticated testing and repair equipment. All testing and repairs are performed at TransCore’s factory. Please contact TransCore to obtain a Return Materials Authorization (RMA) for returning the reader.

**Technical Support**

Authorized dealers and distributors are responsible for the direct support of all customers. Authorized dealers and distributors needing support can locate the appropriate
contact phone number at www.transcore.com/rfidsupport. Send faxes to (214) 461-6478 ATTN: Technical Support. Please be prepared to answer a series of questions that are designed to direct you to the best TransCore support resource available. These questions will relate to symptoms, configuration, model, and tags used.

**Note:** End users and facility operators contacting Technical Support will be referred to the dealer responsible for the system sale.

## Marketing Support

Dealers requiring marketing support may call TransCore Marketing at (214) 461-4031, 9:00 a.m. to 5:00 p.m. Central Standard Time, Monday through Friday. Send faxes to (214) 461-6478 ATTN: TransCore Marketing.

## Find a Problem with the Encompass 4 Reader or Have Suggestions?

Send faxes to (214) 461-6478 ATTN: Encompass 4 Reader product manager.

Glossary

F

field physical area/space in which a tag can be read by the reader; also, an element of a data record/frame. For example, division within a tag’s data frame.

frames consecutive bits of data in memory that are read and written as a group

frequency bands a range of RF frequencies assigned for transmission by an RF device

H

hex base 16 numbering system that uses the characters 0 though 9 and A through F to represent the digits 0 through 16

hexadecimal

host device, generally a computer, that is connected to the Encompass 4 Reader through the communications port

I

I/O or IO circuits input/output circuits

ID identification; encoded information unique to a particular tag

INCITS American National Standards Institute International Committee for Information Technology standards

Intellitag Proprietary name for ANS INCITS 256-2001 compliant Intermec products. A registered trademark of Intermec Technologies Corporation, a UNOV A Company.

interface connection point for communication with another device

IOST I/O status

ISO International Standardization Organization

L

LF line feed

M

m meter
MHz  megahertz
mode  method of operation
ms    milliseconds

N
NAK  negative acknowledgment (data not valid)

P
passback  used to refer to a tag ID that is not passed on to the tag buffer
PC    personal computer
PCKS  EPROM flash checksum
protocol specified convention for the format of data messages communicated between devices
PRST  presence status
PWRB  power fail bit

R
RAM    random access memory
RDID   reader ID
read   process of acquiring data from a device; for example, from a tag or from computer memory
reader controlled interrogating device capable of acquiring data from a device; for example, acquiring and interrupting data from a tag
read zone the physical area in which a tag can be read by the reader
RF     radio frequency
RFID   radio frequency identification
RFST   RF status
ROM    read-only memory
RTC    real-time clock
RTS    request-to-send

### Glossary

**S**
- **SCTS**: status of check tag status
- **SeGo**: Super eGo (SeGo) is a superset of the eGo protocol
- **SN**: serial number
- **som**: start of message
- **SSTC**: input status change reporting options

**T**
- **tag**: small self-contained device acting as an identifying transponder
- **Tau**: timeout delay
- **TT**: tag translation

**V**
- **v**: volts
- **Ver**: version (software)

**W**
- **Wiegand**: the trade name for a technology used in card readers and sensors, particularly for access control applications. Wiegand devices were originally developed by HID Corporation.
- **write**: process of recording data; for example, writing to computer memory or to a tag’s memory. Writing writes over (erases) previous data stored at the specified memory locations.
- **WTI**: Wiegand retransmit interval

**X**
- **XON/XOFF**: protocol for controlling the flow of data between computers and other devices on an asynchronous serial connection. X/ON and X/OFF are signals to turn a transmitter on or off. The actual signal for X/ON is the same bit configuration as the ASCII Ctrl-Q keyboard combination (11 hexadecimal). The X/OFF signal is the Ctrl-S character (13 hexadecimal).
Technical Specifications
Reader Specifications

Communications

Frequency Selection 860 to 930 MHz capable
Reading Range Read performance varies depending on tag, reader, and external antenna (if required) configuration and environment. Optimum read range using the eGo® Plus Sticker Tag is 24.3 ft (7.4 m).
   Typical read range should be 12 to 17 ft (3.7 to 5.2 m).\(^a\)
\(^a\) Reading range depends on reader or external antenna configuration, tag type, tag read mode, and operating environment.

Hardware Features

Integrated System and/or integrated system with connector for external antenna RF module, tag decoder, external antenna (if required), power supply, I/O ports, and serial communications interface all housed in a single package.
Case Weatherproof enclosure. The system is sealed in a tamper-proof, polycarbonate housing.

Power Requirements

Input Voltage 16 to 20V AC, 47 to 63 Hz
   or
   16 to 28V DC

Physical Attributes

Size 15.5 x 15.5 x 3.25 in (39.4 x 39.4 x 8.25 cm)
Weight 9.5 lb (4.3 kg)
**Environmental Parameters**

- **Operating Temperature**: -40°F to +131°F (-40°C to +55°C)
- **Humidity**: 100% noncondensing
- **Vibration Tolerance**: 0.5 G\text{rms}, 10 to 500 Hz

**Options**

- **Communications Interface**: RS–232 and Wiegand or RS–422 and Wiegand
- **Cable Accessory Kits**:
  - 58-1620-001: Connector with 5 ft (1.5 m) cable
  - 58-1620-002: Connector with 20 ft (6.1 m) cable
  - 58-1620-006: Connector with 35 ft (10.7 m) cable
- **Wall Mount Bracket**: Allows adjustment in all planes when used to install the Encompass 4 Reader on a flat surface. Include the part number 54-1620-001 when ordering.
- **Transformer**: A Class C transformer is available to allow 110V AC to 18V AC conversion. Include the part number 76-1620-005 when ordering. A Class C transformer (part number 76-1620-008) to allow 220V AC to 18V AC conversion is available by special request.

Figure C-1 shows the pin assignments for the RS–232 interface signal to the host male DB9 and DB25 connectors.
Cable Supplied with the Encompass 4 Reader

The Encompass 4 Reader is delivered with a multiwire cable (ordered as a separate accessory), which is a 13-pair pigtail. An alternate 15-pair pigtail may be substituted. The 13-pair pigtail is a colored-wire pair cable, with different colors denoting the individual pairs, one pair of which is red/black. The alternate 15-pair pigtail is a red/black-wire pair cable, with numbers on the pairs to denote the individual pairs. Two pairs of the 15-pair pigtail, numbers 14 and 15, are not used.

The following tables show the colored-wire pair (13-pair) and alternate wire pair (15-pair) assignments for the various interfaces, power, and input/output connections.
**RS–232 Interface**

Table C-2 shows the RS–232 assignments for colored-wire pair (13-pair) cable.

This appendix lists the default configuration settings for the Encompass® 4 Reader and its commands. Commands are listed both numerically and alphabetically.

Command Syntax

The command numbers consist of from 2 to 4 hex digits. The letters N or S may follow a command number. The letter N indicates that part of the command number is variable. The letter S indicates the requirement for an alphanumeric data string that is to be included immediately following the command number. Hex digits (0–9, A–F) in either uppercase or lowercase characters may be used in data strings and for hex digits A–F. For more information see Chapter 5, “General Software Information”.

Table D-1 lists factory default settings. Table D-2 on page D-5 lists, in numerical order, all of the commands available to users. Table D-3 on page D-17 lists the same commands by command name.

Factory Default Settings

Note: Table D-1 lists the factory default settings for the Encompass 4 Reader.

**Numerical Command List**

The following conventions are used in Table D-2:

- Items in *bold italics* identify factory default settings.
- Only the command-related data portion of the reader message is shown.

Refer to Chapter 6, “Communication Protocols,” for the complete syntax of commands and messages.

Alphabetical Command List

The following conventions are used in Table D-3:

- Items in **bold italics** identify factory default settings.
- Only the command-related data portion of the reader message is shown.

Refer to Chapter 7 for the complete syntax of commands and messages.

a. If desired, in place of 40 six-bit ASCII characters, the AT5707 can support up to 34 seven-bit ASCII characters.

---

**Tag Data Formats**

Tags are programmed at the TransCore factory with the tag model number, date of manufacture, and data format. Contact TransCore for special order entry procedures for the format that applies to your system. The following four tag data formats can be used:

- 10-character alphanumeric ASCII — Four alphanumeric characters are fixed and can be used to identify either the dealer or the user. The remaining six positions are numeric and should be unique for each tag issued. For example, the entry ACME000001 might be specified as the first tag on the order entry form from ACME Parking Garage.

- 20-character alphanumeric ASCII — Four alphanumeric characters are typically fixed and the remaining 16 positions are numbered sequentially.

- Wiegand — Tags can be programmed in Wiegand formats with 26 to 54 bits. If you choose this format, complete a Wiegand format worksheet — attached to the order entry form — indicating the data to be programmed into the tags.

*Note:* Security access control tag models can be Wiegand-formatted. See Table E-1 through Table E-3 for Wiegand-compatible tag models.

- AAR/ISO — For requirements for this format, refer to ISO 10374 and the most recent version of *Association of American Railroads Standard for Automatic Equipment Identification*.
